

The package `piton`*

F. Pantigny
fpantigny@wanadoo.fr

June 16, 2025

Abstract

The package `piton` provides tools to typeset computer listings, with syntactic highlighting, by using the Lua library LPEG. It requires LuaLaTeX.

1 Presentation

The package `piton` uses the Lua library LPEG¹ for parsing informatic listings and typesets them with syntactic highlighting. Since it uses the Lua of LuaLaTeX, it works with `lualatex` only (and won't work with the other engines: `latex`, `pdflatex` and `xelatex`). It does not use external program and the compilation does not require `--shell-escape`. The compilation is very fast since all the parsing is done by the library LPEG, written in C.

Here is an example of code typeset by `piton`, with the environment `{Piton}`.

```
from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) =  $\frac{\pi}{2}$  for  $x > 0$ )2
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

The main alternatives to the package `piton` are probably the packages `listings` and `minted`.

The name of this extension (`piton`) has been chosen arbitrarily by reference to the pitons used by the climbers in alpinism.

*This document corresponds to the version 4.6 of `piton`, at the date of 2025/06/16.

¹LPEG is a pattern-matching library for Lua, written in C, based on *parsing expression grammars*: <http://www.inf.puc-rio.br/~roberto/lpeg/>

²This LaTeX escape has been done by beginning the comment by `#>`.

2 Installation

The package `piton` is contained in two files: `piton.sty` and `piton.lua` (the LaTeX file `piton.sty` loaded by `\usepackage` will load the Lua file `piton.lua`). Both files must be in a repertory where LaTeX will be able to find them, for instance in a `texmf` tree. However, the best is to install `piton` with a TeX distribution such as MiKTeX, TeX Live or MacTeX.

3 Use of the package

The package `piton` must be used with **LuaLaTeX exclusively**: if another LaTeX engine (`latex`, `pdflatex`, `xelatex`,...) is used, a fatal error will be raised.

3.1 Loading the package

The package `piton` should be loaded by: `\usepackage{piton}`.

The package `piton` uses and *loads* the package `xcolor`. It does not use any exterior program.

3.2 Choice of the computer language

The package `piton` supports two kinds of languages:

- the languages natively supported by `piton`, which are Python, OCaml, C (in fact C++), SQL and two special languages called `minimal` and `verbatim`;
- the languages defined by the final user by using the built-in command `\NewPitonLanguage` described p. 10 (the parsers of those languages can't be as precise as those of the languages supported natively by `piton`).

By default, the language used is Python.

It's possible to change the current language with the command `\PitonOptions` and its key `language`: `\PitonOptions{language = OCaml}`.

In fact, for `piton`, the names of the computer languages are always **case-insensitive**. In this example, we might have written `Ocaml` or `ocaml`.

For the developers, let's say that the name of the current language is stored (in lower case) in the L3 public variable `\l_piton_language_str`.

In what follows, we will speak of Python, but the features described also apply to the other languages.

3.3 The tools provided to the user

The package `piton` provides several tools to typeset informatic codes: the command `\piton`, the environment `{Piton}` and the command `\PitonInputFile`.

- The command `\piton` should be used to typeset small pieces of code inside a paragraph. For example:

```
\piton{def square(x): return x*x}      def square(x): return x*x
```

The syntax and particularities of the command `\piton` are detailed below.

- The environment `{Piton}` should be used to typeset multi-lines code. Since it takes its argument in a verbatim mode, it can't be used within the argument of a LaTeX command. For sake of customization, it's possible to define new environments similar to the environment `{Piton}` with the command `\NewPitonEnvironment`: cf. 4.3 p. 9.
- The command `\PitonInputFile` is used to insert and typeset an external file: cf. 6.3 p. 17.

3.4 The double syntax of the command `\python`

In fact, the command `\python` is provided with a double syntax. It may be used as a standard command of LaTeX taking its argument between curly braces (`\python{...}`) but it may also be used with a syntax similar to the syntax of the command `\verb`, that is to say with the argument delimited by two identical characters (e.g.: `\python|...|` or `\python+...+`).

- **Syntax `\python{...}`**

When its argument is given between curly braces, the command `\python` does not take its argument in verbatim mode. In particular:

- several consecutive spaces will be replaced by only one space (and also the character of end on line),
but the command `_` is provided to force the insertion of a space;
- it's not possible to use `%` inside the argument,
but the command `\%` is provided to insert a `%`;
- the braces must be appear by pairs correctly nested
but the commands `\{` and `\}` are provided for individual braces;
- the LaTeX commands³ of the argument are fully expanded and not executed,
so, it's possible to use `\\` to insert a backslash.

The other characters (including `#`, `^`, `_`, `&`, `$` and `@`) must be inserted without backslash.

Examples :

<code>\python{MyString = '\n'}</code>	<code>MyString = '\n'</code>
<code>\python{def even(n): return n%2==0}</code>	<code>def even(n): return n%2==0</code>
<code>\python{c="#" # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\python{c="#" \ \ \ # an affectation }</code>	<code>c="#" # an affectation</code>
<code>\python{MyDict = {'a': 3, 'b': 4 }}</code>	<code>MyDict = {'a': 3, 'b': 4 }</code>

It's possible to use the command `\python` with that syntax in the arguments of a LaTeX command.⁴

However, since the argument is expanded (in the TeX sens), one should take care not using in its argument *fragile* commands (that is to say commands which are neither *protected* nor *fully expandable*).

- **Syntax `\python|...|`**

When the argument of the command `\python` is provided between two identical characters (all the characters are allowed except `%`, `\`, `#`, `{`, `}` and the space), that argument is taken in a *verbatim mode*. Therefore, with that syntax, the command `\python` can't be used within the argument of another command.

Examples :

<code>\python MyString = '\n' </code>	<code>MyString = '\n'</code>
<code>\python!def even(n): return n%2==0!</code>	<code>def even(n): return n%2==0</code>
<code>\python+c="#" # an affectation +</code>	<code>c="#" # an affectation</code>
<code>\python?MyDict = {'a': 3, 'b': 4}?</code>	<code>MyDict = {'a': 3, 'b': 4}</code>

³That concerns the commands beginning with a backslash but also the active characters (with catcode equal to 13).

⁴For example, it's possible to use the command `\python` in a footnote. Example : `s = 123`.

4 Customization

4.1 The keys of the command `\PitonOptions`

The command `\PitonOptions` takes in as argument a comma-separated list of *key=value* pairs. The scope of the settings done by that command is the current TeX group.⁵

These keys may also be applied to an individual environment `{Piton}` (between square brackets).

- The key `language` specifies which computer language is considered (that key is case-insensitive). It's possible to use the name of the six built-in languages (Python, OCaml, C, SQL, `minimal` and `verbatim`) or the name of a language defined by the user with `\NewPitonLanguage` (cf. part 5, p. 10).

The initial value is `Python`.

- The key `font-command` contains instructions of font which will be inserted at the beginning of all the elements composed by `piton` (without surprise, these instructions are not used for the so-called “LaTeX comments”).

The initial value is `\ttfamily` and, thus, `piton` uses by default the current monospaced font.

- The key `gobble` takes in as value a positive integer *n*: the first *n* characters are discarded (before the process of highlighting of the code) for each line of the environment `{Piton}`. These characters are not necessarily spaces.

When the key `gobble` is used without value, it is equivalent to the key `auto-gobble`, that we describe now.

- When the key `auto-gobble` is in force, the extension `piton` computes the minimal value *n* of the number of consecutive spaces beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of *n*.
- When the key `env-gobble` is in force, `piton` analyzes the last line of the environment `{Piton}`, that is to say the line which contains `\end{Piton}` and determines whether that line contains only spaces followed by the `\end{Piton}`. If we are in that situation, `piton` computes the number *n* of spaces on that line and applies `gobble` with that value of *n*. The name of that key comes from *environment gobble*: the effect of `gobble` is set by the position of the commands `\begin{Piton}` and `\end{Piton}` which delimit the current environment.
- The key `write` takes in as argument a name of file (with its extension) and write the content⁶ of the current environment in that file. At the first use of a file by `piton` (during a given compilation done by LaTeX), it is erased. In fact, the file is written once at the end of the compilation of the file by LuaLaTeX.
- The key `path-write` specifies a path where the files written by the key `write` will be written.

- **New 4.4**

The key `join` is similar to the key `write` but the files which are created are joined (as *joined files*) in the PDF. Be careful: Some PDF readers don't provide any tool to access to these joined files. Among the applications which provide an access to those joined files, we will mention the free application Foxit PDF Reader, which is available on all the platforms.

- **New 4.5**

The key `print` controls whether the content of the environment is actually printed (with the syntactic formatting) in the PDF. Of course, the initial value of `print` is `true`. However, it may be useful to use `print=false` in some circumstances (for example, when the key `write` or the key `join` is used).

⁵We remind that a LaTeX environment is, in particular, a TeX group.

⁶In fact, it's not exactly the body of the environment but the value of `piton.get_last_code()` which is the body without the overwritten LaTeX formatting instructions (cf. the part 7, p. 30).

- The key `line-numbers` activates the line numbering in the environments `{Piton}` and in the listings resulting from the use of `\PitonInputFile`.

In fact, the key `line-numbers` has several subkeys.

- With the key `line-numbers/skip-empty-lines`, the empty lines (which contains only spaces) are considered as non existent for the line numbering (if the key `/absolute`, described below, is in force, the key `/skip-empty-lines` is no-op in `\PitonInputFile`). The initial value of that key is `true` (and not `false`).⁷
- With the key `line-numbers/label-empty-lines`, the labels (that is to say the numbers) of the empty lines are displayed. If the key `/skip-empty-line` is in force, the clé `/label-empty-lines` is no-op. The initial value of that key is `true`.⁸
- With the key `line-numbers/absolute`, in the listings generated in `\PitonInputFile`, the numbers of the lines displayed are *absolute* (that is to say: they are the numbers of the lines in the file). That key may be useful when `\PitonInputFile` is used to insert only a part of the file (cf. part 6.3.2, p. 17). The key `/absolute` is no-op in the environments `{Piton}` and those created by `\NewPitonEnvironment`.
- The key `line-numbers/start` requires that the line numbering begins to the value of the key.
- With the key `line-numbers/resume`, the counter of lines is not set to zero at the beginning of each environment `{Piton}` or use of `\PitonInputFile` as it is otherwise. That allows a numbering of the lines across several environments.
- The key `line-numbers/sep` is the horizontal distance between the numbers of lines (inserted by `line-numbers`) and the beginning of the lines of code. The initial value is 0.7 em.
- The key `line-numbers/format` is a list of tokens which are inserted before the number of line in order to format it. It's possible to put, *at the end* of the list, a LaTeX command with one argument, such as, for example, `\fbox`.
The initial value is `\footnotesize\color{gray}`.

For convenience, a mechanism of factorisation of the prefix `line-numbers` is provided. That means that it is possible, for instance, to write:

```
\PitonOptions
{
  line-numbers =
  {
    skip-empty-lines = false ,
    label-empty-lines = false ,
    sep = 1 em ,
    format = \footnotesize \color{blue}
  }
}
```

- The key `left-margin` corresponds to a margin on the left. That key may be useful in conjunction with the key `line-numbers` if one does not want the numbers in an overlapping position on the left.

It's possible to use the key `left-margin` with the special value `auto`. With that value, if the key `line-numbers` is in force, a margin will be automatically inserted to fit the numbers of lines. See an example part 8.2 on page 31.

- The key `background-color` sets the background color of the environments `{Piton}` and the listings produced by `\PitonInputFile` (it's possible to fix the width of that background with the key `width` or the key `max-width` described below).

⁷For the language Python, the empty lines in the docstrings are taken into account (by design).

⁸When the key `split-on-empty-lines` is in force, the labels of the empty lines are never printed.

The key `background-color` accepts a color defined «on the fly». For example, it's possible to write `background-color = [cmyk]{0.1,0.05,0,0}`.

The key `background-color` supports also as value a *list* of colors. In this case, the successive rows are colored by using the colors of the list in a cyclic way.

New 4.6 In that list, the special color `none` may be use to specify no color at all.

Example : `\PitonOptions{background-color = {gray!15,none}}`

- With the key `prompt-background-color`, `piton` adds a color background to the lines beginning with the prompt “>>>” (and its continuation “...”) characteristic of the Python consoles with REPL (*read-eval-print loop*).
- The key `width` fixes the width of the listing in the PDF. The initial value of that parameter is the current value of `\linewidth`.

That parameter is used for:

- the breaking the lines which are too long (except, of course, when the key `break-lines` is set to false: cf. p. 19);
- the color of the backgrounds specified by the keys `background-color` and `prompt-background-color` described below;
- the width of the LaTeX box created by the key `box` when that key is used (cf. p. 11);
- the width of the graphical box created by the key `tcolorbox` when that key is used.

- **New 4.6**

The key `max-width` is similar to the key `width` but it fixes the *maximal* width of the lines. If all the lines of the listing are shorter than the value provided to `max-width`, the parameter `width` will be equal to the maximal length of the lines of the listing, that is to say the natural width of the listing.

For legibility of the code, `width=min` is a shortcut for `max-width=\linewidth`.

- When the key `show-spaces-in-strings` is activated, the spaces in the strings of characters⁹ are replaced by the character `□` (U+2423 : OPEN BOX). Of course, that character U+2423 must be present in the monospaced font which is used.¹⁰

Example : `my_string = 'Very□good□answer'`

With the key `show-spaces`, all the spaces are replaced by U+2423 (and no line break can occur on those “visible spaces”, even when the key `break-lines`¹¹ is in force). By the way, one should remark that all the trailing spaces (at the end of a line) are deleted by `piton` — and, therefore, won't be represented by `□`. Moreover, when the key `show-spaces` is in force, the tabulations at the beginning of the lines are represented by arrows.

```
\begin{Piton}[language=C,line-numbers,gobble,background-color=gray!15
width=min,splittable=4]
void bubbleSort(int arr[], int n) {
    int temp;
    int swapped;
    for (int i = 0; i < n-1; i++) {
        swapped = 0;
        for (int j = 0; j < n - i - 1; j++) {
            if (arr[j] > arr[j + 1]) {
                temp = arr[j];
                arr[j] = arr[j + 1];
            }
        }
    }
}
```

⁹With the language Python that feature applies only to the short strings (delimited by ' or ") and, in particular, it does not apply for the *doc strings*. In OCaml, that feature does not apply to the *quoted strings*.

¹⁰The initial value of `font-command` is `\ttfamily` and, thus, by default, `piton` merely uses the current monospaced font.

¹¹cf. 6.4.1 p. 19

```

        arr[j + 1] = temp;
        swapped = 1;
    }
}
if (!swapped) break;
}
}
\end{Piton}

1 void bubbleSort(int arr[], int n) {
2     int temp;
3     int swapped;
4     for (int i = 0; i < n-1; i++) {
5         swapped = 0;
6         for (int j = 0; j < n - i - 1; j++) {
7             if (arr[j] > arr[j + 1]) {
8                 temp = arr[j];
9                 arr[j] = arr[j + 1];
10                arr[j + 1] = temp;
11                swapped = 1;
12            }
13        }
14        if (!swapped) break;
15    }
16 }

```

The command `\PitonOptions` provides in fact several other keys which will be described further (see in particular the “Pages breaks and line breaks” p. 19).

4.2 The styles

4.2.1 Notion of style

The package `piton` provides the command `\SetPitonStyle` to customize the different styles used to format the syntactic elements of the informatic listings. The customizations done by that command are limited to the current TeX group.¹²

The command `\SetPitonStyle` takes in as argument a comma-separated list of *key=value* pairs. The keys are names of styles and the value are LaTeX formatting instructions.

These LaTeX instructions must be formatting instructions such as `\color{...}`, `\bfseries`, `\slshape`, etc. (the commands of this kind are sometimes called *semi-global* commands). It’s also possible to put, *at the end of the list of instructions*, a LaTeX command taking exactly one argument.

Here an example which changes the style used to highlight, in the definition of a Python function, the name of the function which is defined. That code uses the command `\highLight` of `lua-ul` (that package requires also the package `luacolor`).

```
\SetPitonStyle{ Name.Function = \bfseries \highLight[red!30] }
```

In that example, `\highLight[red!30]` must be considered as the name of a LaTeX command which takes in exactly one argument, since, usually, it is used with `\highLight[red!30]{...}`.

With that setting, we will have : `def cube(x) : return x * x * x`

The different styles, and their use by `piton` in the different languages which it supports (Python, OCaml, C, SQL, “minimal” and “verbatim”), are described in the part 9, starting at the page 37.

¹²We remind that a LaTeX environment is, in particular, a TeX group.

The command `\PitonStyle` takes in as argument the name of a style and allows to retrieve the value (as a list of LaTeX instructions) of that style. That command is *fully expandable* (in the TeX sens). For example, it's possible to write `{\PitonStyle{Keyword}{function}}` and we will have the word **function** formatted as a keyword.

The syntax `{\PitonStyle{style}{...}}` is mandatory in order to be able to deal both with the semi-global commands and the commands with arguments which may be present in the definition of the style *style*.

4.2.2 Global styles and local styles

A style may be defined globally with the command `\SetPitonStyle`. That means that it will apply to all the computer languages that use that style.

For example, with the command

```
\SetPitonStyle{Comment = \color{gray}}
```

all the comments will be composed in gray in all the listings, whatever computer language they use (Python, C, OCaml, etc. or a language defined by the command `\NewPitonLanguage`).

But it's also possible to define a style locally for a given informatic language by providing the name of that language as optional argument (between square brackets) to the command `\SetPitonStyle`.¹³

For example, with the command

```
\SetPitonStyle[SQL]{Keyword = \color[HTML]{006699} \bfseries \MakeUppercase}
```

the keywords in the SQL listings will be composed in capital letters, even if they appear in lower case in the LaTeX source (we recall that, in SQL, the keywords are case-insensitive).

As expected, if a computer language uses a given style and if that style has no local definition for that language, the global version is used. That notion of “global style” has no link with the notion of global definition in TeX (the notion of *group* in TeX).¹⁴

The package `piton` itself (that is to say the file `piton.sty`) defines all the styles globally.

4.2.3 The style `UserFunction`

The extension `piton` provides a special style called `UserFunction`. That style applies to the names of the functions previously defined by the user (for example, in Python, these names are those following the keyword `def` in a previous Python listing). The initial value of that style `\PitonStyle{Identifier}` and, therefore, the names of the functions are formatted like the other identifiers (that is to say, by default, with no special formatting except the features provided in `font-command`). However, it's possible to change the value of that style, as any other style, with the command `\SetPitonStyle`.

In the following example, we tune the styles `Name.Function` and `UserFunction` so as to have clickable names of functions linked to the (informatic) definition of the function.

```
\NewDocumentCommand{\MyDefFunction}{m}
  {\hypertarget{piton:#1}{\color[HTML]{CC00FF}{#1}}}
\NewDocumentCommand{\MyUserFunction}{m}{\hyperlink{piton:#1}{#1}}

\SetPitonStyle{Name.Function = \MyDefFunction, UserFunction = \MyUserFunction}
```

¹³We recall, that, in the package `piton`, the names of the computer languages are case-insensitive.

¹⁴As regards the TeX groups, the definitions done by `\SetPitonStyle` are always local.

```
def transpose(v,i,j):
    x = v[i]
    v[i] = v[j]
    v[j] = x

def passe(v):
    for i in range(0,len(v)-1):
        if v[i] > v[i+1]:
            transpose(v,i,i+1)
```

(Some PDF viewers display a frame around the clickable word `transpose` but other do not.)

Of course, the list of the names of Python functions previously defined is kept in the memory of LuaLaTeX (in a global way, that is to say independently of the TeX groups). The extension `piton` provides a command to clear that list : it's the command `\PitonClearUserFunctions`. When it is used without argument, that command is applied to all the informatic languages used by the user but it's also possible to use it with an optional argument (between square brackets) which is a list of computer languages to which the command will be applied.¹⁵

4.3 Creation of new environments

Since the environment `{Piton}` has to catch its body in a special way (more or less as verbatim text), it's not possible to construct new environments directly over the environment `{Piton}` with the classical commands `\newenvironment` (of standard LaTeX) or `\NewDocumentEnvironment` (of LaTeX3).

With a LaTeX kernel newer than 2025-06-01, it's possible to use `\NewEnvironmentCopy` on the environment `{Piton}` but it's not very powerful.

That's why `piton` provides a command `\NewPitonEnvironment`. That command takes in three mandatory arguments.

That command has the same syntax as the classical environment `\NewDocumentEnvironment`.¹⁶

New 4.5

The version 4.5 provides the commands `\RenewPitonEnvironment`, `\DeclarePitonEnvironment` and `\ProvidePitonEnvironment` (similar to the corresponding commands of L3).

With the following instruction, a new environment `{Python}` will be constructed with the same behaviour as `{Piton}`:

```
\NewPitonEnvironment{Python}{0}{\PitonOptions{#1}}{}
```

If one wishes to format Python code in a box of `mdframed`, it's possible to define an environment `{Python}` with the following code (of course, the package `mdframed` must be loaded, and, in this document, it has been loaded with the key `framemethod=tikz`).

```
\NewPitonEnvironment{Python}{}
{\begin{mdframed}[roundcorner=3mm]}
{\end{mdframed}}
```

With this new environment `{Python}`, it's possible to write:

```
\begin{Python}
def square(x):
    """Compute the square of x"""
    return x*x
\end{Python}
```

¹⁵We remind that, in `piton`, the name of the computer languages are case-insensitive.

¹⁶However, the specifier of argument `b` (used to catch the body of the environment as a LaTeX argument) is not allowed (of course)

```
def square(x):
    """Compute the square of x"""
    return x*x
```

It's possible to a similar construction with an environment of `tcolorbox`. However, for a better cooperation between `piton` and `tcolorbox`, the extension `piton` provides a key `tcolorbox`: cf. p. 13.

5 Definition of new languages with the syntax of listings

The package `listings` is a famous LaTeX package to format informatic listings.

That package provides a command `\lstdefinlanguage` which allows the user to define new languages. That command is also used by `listings` itself to provide the definition of the predefined languages in `listings` (in fact, for this task, `listings` uses a command called `\lst@definlanguage` but that command has the same syntax as `\lstdefinlanguage`).

The package `piton` provides a command `\NewPitonLanguage` to define new languages (available in `\piton`, `{Piton}`, etc.) with a syntax which is almost the same as the syntax of `\lstdefinlanguage`. Let's precise that `piton` does *not* use that command to define the languages provided natively (Python, OCaml, C, SQL, `minimal` and `verbatim`), which allows more powerful parsers.

For example, in the file `lstlang1.sty`, which is one of the definition files of `listings`, we find the following instructions (in version 1.10a).

```
\lstdefinlanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%
    const,continue,default,do,double,else,extends,false,final,%
    finally,float,for,goto,if,implements,import,instanceof,int,%
    interface,label,long,native,new,null,package,private,protected,%
    public,return,short,static,super,switch,synchronized,this,throw,%
    throws,transient,true,try,void,volatile,while},%
sensitive,%
morecomment=[l]//,%
morecomment=[s]{/*}{*/},%
morestring=[b]" ,%
morestring=[b]' ,%
}[keywords,comments,strings]
```

In order to define a language called `Java` for `piton`, one has only to write the following code **where the last argument of `\lst@definlanguage`, between square brackets, has been discarded** (in fact, the symbols `%` may be deleted without any problem).

```
\NewPitonLanguage{Java}%
{morekeywords={abstract,boolean,break,byte,case,catch,char,class,%

}
```

It's possible to use the language `Java` like any other language defined by `piton`.

Here is an example of code formatted in an environment `{Piton}` with the key `language=Java`.¹⁷

```
public class Cipher { // Caesar cipher
    public static void main(String[] args) {
        String str = "The quick brown fox Jumped over the lazy Dog";
        System.out.println( Cipher.encode( str, 12 ));
        System.out.println( Cipher.decode( Cipher.encode( str, 12), 12 ));
    }

    public static String decode(String enc, int offset) {
        return encode(enc, 26-offset);
    }

    public static String encode(String enc, int offset) {
        offset = offset % 26 + 26;
        StringBuilder encoded = new StringBuilder();
        for (char i : enc.toCharArray()) {
            if (Character.isLetter(i)) {
                if (Character.isUpperCase(i)) {
                    encoded.append((char) ('A' + (i - 'A' + offset) % 26 ));
                } else {
                    encoded.append((char) ('a' + (i - 'a' + offset) % 26 ));
                }
            } else {
                encoded.append(i);
            }
        }
        return encoded.toString();
    }
}
```

The keys of the command `\lstdefinelineage` of listings supported by `\NewPitonLanguage` are: `morekeywords`, `otherkeywords`, `sensitive`, `keywordsprefix`, `moretexcs`, `morestring` (with the letters `b`, `d`, `s` and `m`), `morecomment` (with the letters `i`, `l`, `s` and `n`), `moredelim` (with the letters `i`, `l`, `s`, `*` and `**`), `moredirectives`, `tag`, `alsodigit`, `alsoletter` and `alsoother`.

For the description of those keys, we redirect the reader to the documentation of the package listings (type `texdoc listings` in a terminal).

For example, here is a language called “LaTeX” to format LaTeX chunks of codes:

```
\NewPitonLanguage{LaTeX}{keywordsprefix = \ , alsoletter = _ }
```

Initially, the characters `@` and `_` are considered as letters because, in many computer languages, they are allowed in the keywords and the names of the identifiers. With `alsoletter = @_`, we retrieve them from the category of the letters.

6 Advanced features

6.1 The key “box”

New 4.6

If one wishes to compose a listing in a box of LaTeX, he should use the key `box`. That key takes in as value `c`, `t` or `b` corresponding to the parameter of vertical position (as for the environment `{minipage}` of LaTeX). The default value is `c` (as for `{minipage}`).

When the key `box` is used, `width=min` is activated (except, of course, when the key `width` or the key `max-width` is explicitly used). For the keys `width` and `max-width`, cf. p. 6.

¹⁷We recall that, for `piton`, the names of the computer languages are case-insensitive. Hence, it's possible to write, for instance, `language=java`.

```

\begin{center}
\PytonOptions{box,background-color=gray!15}
\begin{Pyton}
def square(x):
    return x*x
\end{Pyton}
\hspace{1cm}
def cube(x):
    return x*x*x
\end{Pyton}
\end{center}

```

```

def square(x):
    return x*x

```

```

def cube(x):
    return x*x*x

```

It's possible to use the key `box` with a numerical value for the key `width`.

```

\begin{center}
\PytonOptions{box,width=5cm,background-color=gray!15}
\begin{Pyton}
def square(x):
    return x*x
\end{Pyton}
\hspace{1cm}
def cube(x):
    return x*x*x
\end{Pyton}
\end{center}

```

```

def square(x):
    return x*x

```

```

def cube(x):
    return x*x*x

```

Here is an example with the key `max-width`.

```

\begin{center}
\PytonOptions{box=t,max-width=7cm,background-color=gray!15}
\begin{Pyton}
def square(x):
    return x*x
\end{Pyton}
\hspace{1cm}
\begin{Pyton}
def P(x):
    return 24*x**8 - 7*x**7 + 12*x**6 - 4*x**5 + 4*x**3 + x**2 - 5*x + 2
\end{Pyton}
\end{center}

```

```

def square(x):
    return x*x

```

```

def P(x):
    return 24*x**8 - 7*x**7 + \
+ 12*x**6 - 4*x**5 + 4*x**3 + x**2 - \
+ 5*x + 2

```

6.2 The key “tcolorbox”

The extension `piton` provides a key `tcolorbox` in order to ease the use of the extension `tcolorbox` in conjunction with the extension `piton`. However, the extension `piton` does not load `tcolorbox` and the final user should have loaded it. Moreover, he must load the library `breakable` of `tcolorbox` with `\tcboxuselibrary{breakable}` in the preamble of the LaTeX document. If this is not the case, an error will be raised at the first use of the key `tcolorbox`.

When the key `tcolorbox` is used, the listing formatted by `piton` is included in an environment `{tcolorbox}`. That applies both to the command `\PitonInputFile` and the environment `{Piton}` (or, more generally, an environment created by the dedicated command `\NewPitonEnvironment`: cf. p. 9). If the key `splittable` of `piton` is used (cf. p. 20), the graphical box created by `tcolorbox` will be splittable by a change of page.

In the present document, we have loaded, besides `tcolorbox` and its library `breakable`, the library `skins` of `tcolorbox` and we have activated the “*skin*” `enhanced`, in order to have a better appearance at the page break.

```
\tcboxuselibrary{skins,breakable} % in the preamble
\tcbset{enhanced}                 % in the preamble

\begin{Piton}[tcolorbox,splittable=3]
def carré(x):
    """Computes the square of x"""
    return x*x
...
def carré(x):
    """Computes the square of x"""
    return x*x
\end{Piton}
```

```
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
def carré(x):
    """Computes the square of x"""
    return x*x
```

```

    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x

```

If we want an output composed in a LaTeX box (despite its name, an environment of `tcolorbox` does not always create a LaTeX box), we only have to use key `box` provided by `piton` (cf. p. 11). Of course, such LaTeX box can't be broken by a change of page.

We recall that, when the key `box` is used, `width=min` is activated (except, when the key `width` or the key `max-width` is explicitly used).

```

\begin{center}
\PitonOptions{tcolorbox,box=t}
\begin{Piton}
def square(x):
    return x*x
\end{Piton}
\hspace{1cm}
\begin{Piton}
def cube(x):
    """The cube of x"""
    return x*x*x
\end{Piton}
\end{center}

```

```

def square(x):
    return x*x

```

```

def cube(x):
    """The cube of x"""
    return x*x*x

```

For a more sophisticated example of use of the key `tcolorbox`, see the example given at the page 32.

6.3 Insertion of a file

6.3.1 The command `\PitonInputFile`

The command `\PitonInputFile` includes the content of the file specified in argument (or only a part of that file: see below). The extension `piton` also provides the commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF` with supplementary arguments corresponding to the letters T and F. Those arguments will be executed if the file to include has been found (letter T) or not found (letter F).

The syntax for the pathes (absolute or relative) is the following one:

- The paths beginning by `/` are absolute.

Example : `\PitonInputFile{/Users/joe/Documents/program.py}`

- The paths which do not begin with `/` are relative to the current repertory.

Example : `\PitonInputFile{my_listings/program.py}`

The key `path` of the command `\PitonOptions` specifies a *list* of paths where the files included by `\PitonInputFile` will be searched. That list is comma separated.

As previously, the absolute paths must begin with `/`.

6.3.2 Insertion of a part of a file

The command `\PitonInputFile` inserts (with formatting) the content of a file. In fact, it's possible to insert only a *part* of that file. Two mechanisms are provided in this aim.

- It's possible to specify the part that we want to insert by the numbers of the lines (in the original file).
- It's also possible to specify the part to insert with textual markers.

In both cases, if we want to number the lines with the numbers of the lines in the file, we have to use the key `line-numbers/absolute`.

With line numbers

The command `\PitonInputFile` supports the keys `first-line` and `last-line` in order to insert only the part of file between the corresponding lines. Not to be confused with the key `line-numbers/start` which fixes the first line number for the line numbering. In a sens, `line-numbers/start` deals with the output whereas `first-line` and `last-line` deal with the input.

With textual markers

In order to use that feature, we first have to specify the format of the markers (for the beginning and the end of the part to include) with the keys `marker-beginning` and `marker-end` (usually with the command `\PitonOptions`).

Let us take a practical example.

We assume that the file to include contains solutions to exercises of programming on the following model.

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

The markers of the beginning and the end are the strings `#[Exercise 1]` and `#<Exercise 1>`. The string “Exercise 1” will be called the *label* of the exercise (or of the part of the file to be included). In order to specify such markers in `piton`, we will use the keys `marker/beginning` and `marker/end` with the following instruction (the character `#` of the comments of Python must be inserted with the protected form `\#`).

```
\PitonOptions{ marker/beginning = \#[#1] , marker/end = \#<#1> }
```

As one can see, `marker/beginning` is an expression corresponding to the mathematical function which transforms the label (here `Exercise 1`) into the the beginning marker (in the example `#[Exercise 1]`). The string `#1` corresponds to the occurrences of the argument of that function, which the classical syntax in TeX. Idem for `marker/end`.¹⁸

Now, you only have to use the key `range` of `\PitonInputFile` to insert a marked content of the file.

```
\PitonInputFile[range = Exercise 1]{file_name}
```

```
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
```

The key `marker/include-lines` requires the insertion of the lines containing the markers.

```
\PitonInputFile[marker/include-lines,range = Exercise 1]{file_name}
```

```
#[Exercise 1] Iterative version
def fibo(n):
    if n==0: return 0
    else:
        u=0
        v=1
        for i in range(n-1):
            w = u+v
            u = v
            v = w
        return v
#<Exercise 1>
```

In fact, there exist also the keys `begin-range` and `end-range` to insert several marked contents at the same time.

For example, in order to insert the solutions of the exercises 3 to 5, we will write (if the file has the correct structure!):

```
\PitonInputFile[begin-range = Exercise 3, end-range = Exercise 5]{file_name}
```

¹⁸In regard to LaTeX, both functions must be *fully expandable*.

6.4 Page breaks and line breaks

6.4.1 Line breaks

By default, the elements produced by `piton` can't be broken by an end of line. However, there are keys to allow such breaks (the possible breaking points are the spaces, even the spaces which appear in the strings of the computer languages).

- With the key `break-lines-in-piton`, the line breaks are allowed in the command `\piton{...}` (but not in the command `\piton|...|`, that is to say the command `\piton` in verbatim mode).
- With the key `break-lines-in-Piton`, the line breaks are allowed in the environment `{Piton}` (hence the capital letter P in the name) and in the listings produced by `\PitonInputFile`. The initial value of that parameter is `true` (and not `false`).
- The key `break-lines` is a conjunction of the two previous keys.

The package `piton` provides also several keys to control the appearance on the line breaks allowed by `break-lines-in-Piton`.

- With the key `indent-broken-lines`, the indentation of a broken line is respected at carriage return (on the condition that the used font is a monospaced font and this is the case by default since the initial value of `font-command` is `\ttfamily`).
- The key `end-of-broken-line` corresponds to the symbol placed at the end of a broken line. The initial value is: `\hspace*{0.5em}\textbackslash`.
- The key `continuation-symbol` corresponds to the symbol placed at each carriage return. The initial value is: `+;` (the command `\;` inserts a small horizontal space).
- The key `continuation-symbol-on-indentation` corresponds to the symbol placed at each carriage return, on the position of the indentation (only when the key `indent-broken-line` is in force). The initial value is: `$_hookrightarrow\;$`.

The following code has been composed with the following tuning:

```
\PitonOptions{width=12cm,break-lines,indent-broken-lines,background-color=gray!15}
```

```
def dict_of_list(l):  
    """Converts a list of subrs and descriptions of glyphs in \  
    ↪ a dictionary"""  
    our_dict = {}  
    for list_letter in l:  
        if (list_letter[0][0:3] == 'dup'): # if it's a subr  
            name = list_letter[0][4:-3]  
            print("We treat the subr of number " + name)  
        else:  
            name = list_letter[0][1:-3] # if it's a glyph  
            print("We treat the glyph of number " + name)  
            our_dict[name] = [treat_Postscript_line(k) for k in \  
            ↪ list_letter[1:-1]]  
    return dict
```

With the key `break-strings-anywhere`, the strings may be broken anywhere (and not only on the spaces).

With the key `break-numbers-anywhere`, the numbers may be broken anywhere.

6.4.2 Page breaks

By default, the listings produced by the environment `{Piton}` and the command `\PitonInputFile` are not breakable.

However, `piton` provides the keys `splittable-on-empty-lines` and `splittable` to allow such breaks.

- The key `splittable-on-empty-lines` allows breaks on the empty lines. The “empty lines” are in fact the lines which contains only spaces.
- Of course, the key `splittable-on-empty-lines` may not be sufficient and that’s why `piton` provides the key `splittable`.

When the key `splittable` is used with the numeric value n (which must be a positive integer) the listing, or each part of the listing delimited by empty lines (when `split-on-empty-lines` is in force) may be broken anywhere with the restriction that no break will occur within the n first lines of the listing or within the n last lines.¹⁹

For example, a tuning with `splittable = 4` may be a good choice.

When used without value, the key `splittable` is equivalent to `splittable = 1` and the listings may be broken anywhere (it’s probably not recommandable).

The initial value of the key `splittable` is equal to 100 (by default, the listings are not breakable at all).

Even with a background color (set by the key `background-color`), the pages breaks are allowed, as soon as the key `split-on-empty-lines` or the key `splittable` is in force.²⁰

6.5 Splitting of a listing in sub-listings

The extension `piton` provides the key `split-on-empty-lines`, which should not be confused with the key `splittable-on-empty-lines` previously defined.

In order to understand the behaviour of the key `split-on-empty-lines`, one should imagine that he has to compose an informatic listing which contains several definitions of informatic functions. Usually, in the informatic languages, those definitions of functions are separated by empty lines.

The key `split-on-empty-lines` splits the listings on the empty lines. Several empty lines are deleted and replaced by the content of the parameter corresponding to the key `split-separation`.

- That parameter must contain elements allowed to be inserted in *vertical mode* of TeX. For example, it’s possible to put the TeX primitive `\hrule`.
- The initial value of this parameter is `\vspace{\baselineskip}\vspace{-1.25pt}` which corresponds eventually to an empty line in the final PDF (this vertical space is deleted if it occurs on a page break). If the key `background-color` is in force, no background color is added to that empty line.

Each chunk of the informatic listing is composed in an environment whose name is given by the key `env-used-by-split`. The initial value of that parameter is, not surprisingly, `Piton` and, hence, the different chunks are composed in several environments `{Piton}`. If one decides to change the value of `env-used-by-split`, he should use the name of an environment created by `\NewPitonEnvironment` (cf. part 4.3, p. 9).

Each chunk of the informatic listing is formatted in its own environment. Therefore, it has its own line numbering (if the key `line-numbers` is in force) and its own colored background (when the key `background-color` is in force), separated from the background color of the other chunks. When used, the key `splittable` applies in each chunk (independently of the other chunks). Of course, a page break may occur between the chunks of code, regardless of the value of `splittable`.

¹⁹Remark that we speak of the lines of the original informatic listing and such line may be composed on several lines in the final PDF when the key `break-lines-in-Piton` is in force.

²⁰With the key `splittable`, the environments `{Piton}` are breakable, even within a (breakable) environment of `tcolorbox`. Remind that an environment of `tcolorbox` included in another environment of `tcolorbox` is *not* breakable, even when both environments use the key `breakable` of `tcolorbox`.

```
\begin{Piton}[split-on-empty-lines,background-color=gray!15,line-numbers]
def square(x):
    """Computes the square of x"""
    return x*x

def cube(x):
    """Calcule the cube of x"""
    return x*x*x
\end{Piton}
```

```
1 def square(x):
2     """Computes the square of x"""
3     return x*x
```

```
1 def cube(x):
2     """Calcule the cube of x"""
3     return x*x*x
```

Caution: Since each chunk is treated independently of the others, the commands specified by `detected-commands` or `raw-detected-commands` (cf. p. 23) and the commands and environments of Beamer automatically detected by `piton` must not cross the empty lines of the original listing.

6.6 Highlighting some identifiers

The command `\SetPitonIdentifier` allows to automatically change the formatting of some identifiers. That change is only based on the name of those indentifiers.

That command takes in three arguments:

- The optional argument (within square brackets) specifies the informatic language. If this argument is not present, the tunings done by `\SetPitonIdentifier` will apply to all the computer languages of `piton`.²¹
- The first mandatory argument is a comma-separated list of names of identifiers.
- The second mandatory argument is a list of LaTeX instructions of the same type as `piton` “styles” previously presented (cf. 4.2 p. 7).

Caution: Only the identifiers may be concerned by that key. The keywords and the built-in functions won’t be affected, even if their name appear in the first argument of the command `\SetPitonIdentifier`.

```
\SetPitonIdentifier{l1,l2}{\color{red}}
\begin{Piton}
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
\end{Piton}
```

²¹We recall, that, in the package `piton`, the names of the computer languages are case-insensitive.

```
def tri(l):
    """Segmentation sort"""
    if len(l) <= 1:
        return l
    else:
        a = l[0]
        l1 = [ x for x in l[1:] if x < a ]
        l2 = [ x for x in l[1:] if x >= a ]
        return tri(l1) + [a] + tri(l2)
```

By using the command `\SetPitonIdentifier`, it's possible to add other built-in functions (or other new keywords, etc.) that will be detected by `piton`.

```
\SetPitonIdentifier[Python]
{cos, sin, tan, floor, ceil, trunc, pow, exp, ln, factorial}
{\PitonStyle{Name.Builtin}}

\begin{Piton}
from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
\end{Piton}

from math import *
cos(pi/2)
factorial(5)
ceil(-2.3)
floor(5.4)
```

6.7 Mechanisms to escape to LaTeX

The package `piton` provides several mechanisms for escaping to LaTeX:

- It's possible to compose comments entirely in LaTeX.
- It's possible to have the elements between `$` in the comments composed in LaTeX mathematical mode.
- It's possible to ask `piton` to detect automatically some LaTeX commands, thanks to the keys `detected-commands`, `raw-detected-commands` and `vertical-detected-commands`.
- It's also possible to insert LaTeX code almost everywhere in a Python listing.

One should also remark that, when the extension `piton` is used with the class `beamer`, `piton` detects in `{Piton}` many commands and environments of Beamer: cf. 6.8 p. 26.

6.7.1 The “LaTeX comments”

In this document, we call “LaTeX comments” the comments which begins by `#>`. The code following those characters, until the end of the line, will be composed as standard LaTeX code. There is two tools to customize those comments.

- It's possible to change the syntactic mark (which, by default, is `#>`). For this purpose, there is a key `comment-latex` available only in the preamble of the document, allows to choice the characters which, preceded by `#`, will be the syntactic marker.

For example, if the preamble contains the following instruction:

```
\PitonOptions{comment-latex = LaTeX}
```

the LaTeX comments will begin by `#LaTeX`.

If the key `comment-latex` is used with the empty value, all the Python comments (which begins by `#`) will, in fact, be “LaTeX comments”.

- It’s possible to change the formatting of the LaTeX comment itself by changing the `piton style Comment.LaTeX`.

For example, with `\SetPitonStyle{Comment.LaTeX = \normalfont\color{blue}}`, the LaTeX comments will be composed in blue.

If you want to have a character `#` at the beginning of the LaTeX comment in the PDF, you can use `set Comment.LaTeX` as follows:

```
\SetPitonStyle{Comment.LaTeX = \color{gray}\#\normalfont\space }
```

For other examples of customization of the LaTeX comments, see the part 8.3 p. 32

If the user has required line numbers (with the key `line-numbers`), it’s possible to refer to a number of line with the command `\label` used in a LaTeX comment.²²

6.7.2 The key “math-comments”

It’s possible to request that, in the standard Python comments (that is to say those beginning by `#` and not `#>`), the elements between `$` be composed in LaTeX mathematical mode (the other elements of the comment being composed verbatim).

That feature is activated by the key `math-comments`, *which is available only in the preamble of the document*.

Here is a example, where we have assumed that the preamble of the document contains the instruction `\PitonOptions{math-comment}`:

```
\begin{Piton}
def square(x):
    return x*x # compute  $x^2$ 
\end{Piton}

def square(x):
    return x*x # compute  $x^2$ 
```

6.7.3 The key “detected-commands” and its variants

The key `detected-commands` of `\PitonOptions` allows to specify a (comma-separated) list of names of LaTeX commands that will be detected directly by `piton`.

- The key `detected-commands` must be used in the preamble of the LaTeX document.
- The names of the LaTeX commands must appear without the leading backslash (eg. `detected-commands = { emph, textbf }`).
- These commands must be LaTeX commands with only one (mandatory) argument between braces (and these braces must appear explicitly in the informatic listing).
- These commands must be **protected**²³ against expansion in the TeX sens (because the command `\piton` expands its arguments before throwing it to Lua for syntactic analysis).

²²That feature is implemented by using a redefinition of the standard command `\label` in the environments `{Piton}`. Therefore, incompatibilities may occur with extensions which redefine (globally) that command `\label` (for example: `varioref`, `refcheck`, `showlabels`, etc.)

²³We recall that the command `\NewDocumentCommand` creates protected commands, unlike the historical LaTeX command `\newcommand` (and unlike the command `\def` of TeX).

In the following example, which is a recursive programming of the factorial function, we decide to highlight the recursive call. The command `\highLight` of lua-ul²⁴ directly does the job with the easy syntax `\highLight{...}`.

We assume that the preamble of the LaTeX document contains the following line:

```
\PitonOptions{detected-commands = highLight}
```

Then, it's possible to write directly:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        \highLight{return n*fact(n-1)}
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

New 4.3

The key `raw-detected-commands` is similar to the key `detected-commands` but `piton` won't do any syntactic analysis of the arguments of the LaTeX commands which are detected.

If there is a line break within the argument of a command detected by the mean of `raw-detected-commands`, that line break is replaced by a space (as does LaTeX by default).

Imagine, for example, that we wish, in the main text of a document, introduce some specifications of tables of the language SQL by the the name of the table, followed, between brackets, by the names of its fields (ex. : `client(name,town)`).

If we insert that element in a command `\piton`, the word *client* won't be recognized as a name of table but as a name of field. It's possible to define a personal command `\NomTable` which we will apply by hand to the names of the tables. In that aim, we declare that command with `raw-detected-commands` and, thus, its argument won't be re-analyzed by `piton` (that second analysis would format it as a name of field).

In the preamble of the LaTeX document, we insert the following lines:

```
\NewDocumentCommand{\NameTable}{m}{{\PitonStyle{Name.Table}{#1}}}%
\PitonOptions{language=SQL, raw-detected-commands = NameTable}
```

In the main document, the instruction:

```
Exemple : \piton{\NameTable{client} (name, town)}
```

produces the following output :

```
Exemple : client (nom, prénom)
```

New 4.6

The key `vertical-detected-commands` is similar to the key `raw-detected-commands` but the commands which are detected by this key must be LaTeX commands (with one argument) which are executed in *vertical* mode between the lines of the code.

For example, it's possible to detect the command `\newpage` by

```
\PitonOptions{vertical-detected-commands = newpage}
```

²⁴The package lua-ul requires itself the package luacolor.

and ask in a listing a mandatory break of page with `\newpage{}`:

```
\begin{Piton}
def square(x):
    return x*x \newpage{}
def cube(x):
    return x*x*x
\end{Piton}
```

6.7.4 The mechanism “escape”

It’s also possible to overwrite the informatic listings to insert LaTeX code almost everywhere (but between lexical units, of course). By default, `piton` does not fix any delimiters for that kind of escape. In order to use this mechanism, it’s necessary to specify the delimiters which will delimit the escape (one for the beginning and one for the end) by using the keys `begin-escape` and `end-escape`, *available only in the preamble of the document*.

We consider once again the previous example of a recursive programming of the factorial. We want to highlight in pink the instruction containing the recursive call. With the package `lua-ul`, we can use the syntax `\highlight[LightPink]{...}`. Because of the optional argument between square brackets, it’s not possible to use the key `detected-commands` but it’s possible to achieve our goal with the more general mechanism “escape”.

We assume that the preamble of the document contains the following instruction:

```
\PitonOptions{begin-escape=!,end-escape=!}
```

Then, it’s possible to write:

```
\begin{Piton}
def fact(n):
    if n==0:
        return 1
    else:
        !\highlight[LightPink]{!return n*fact(n-1)!}!
\end{Piton}

def fact(n):
    if n==0:
        return 1
    else:
        return n*fact(n-1)
```

Caution : The mechanism “escape” is not active in the strings nor in the Python comments (however, it’s possible to have a whole Python comment composed in LaTeX by beginning it with `#>`; such comments are merely called “LaTeX comments” in this document).

6.7.5 The mechanism “escape-math”

The mechanism “escape-math” is very similar to the mechanism “escape” since the only difference is that the elements sent to LaTeX are composed in the math mode of LaTeX.

This mechanism is activated with the keys `begin-escape-math` and `end-escape-math` (*which are available only in the preamble of the document*).

Despite the technical similarity, the use of the the mechanism “escape-math” is in fact rather different from that of the mechanism “escape”. Indeed, since the elements are composed in a mathematical mode of LaTeX, they are, in particular, composed within a TeX group and, therefore, they can’t be used to change the formatting of other lexical units.

In the languages where the character `$` does not play a important role, it’s possible to activate that mechanism “escape-math” with the character `$`:

```
\PitonOptions{begin-escape-math=$,end-escape-math=$}
```

Note: the character \$ must *not* be protected by a backslash.

However, it's probably more prudent to use `\(et \)`, which are delimiters of the mathematical mode provided by LaTeX.

```
\PitonOptions{begin-escape-math=\(,end-escape-math=\)}
```

Here is an example of use.

```
\begin{Piton}[line-numbers]
def arctan(x,n=10):
    if \(x < 0\) :
        return \(-\arctan(-x)\)
    elif \(x > 1\) :
        return \(\pi/2 - \arctan(1/x)\)
    else:
        s = \(\)
        for \(k\) in range(\(n\)): s += \(\smash{\frac{(-1)^k}{2k+1} x^{2k+1}}\)
        return s
\end{Piton}
```

```
1 def arctan(x,n=10):
2     if x < 0 :
3         return -arctan(-x)
4     elif x > 1 :
5         return pi/2 - arctan(1/x)
6     else:
7         s = 0
8         for k in range(n): s +=  $\frac{(-1)^k}{2k+1} x^{2k+1}$ 
9         return s
```

6.8 Behaviour in the class Beamer

First remark

Since the environment `{Piton}` catches its body with a verbatim mode, it's necessary to use the environments `{Piton}` within environments `{frame}` of Beamer protected by the key `fragile`, i.e. beginning with `\begin{frame}[fragile]`.²⁵

When the package `piton` is used within the class `beamer`²⁶, the behaviour of `piton` is slightly modified, as described now.

6.8.1 `{Piton}` and `\PitonInputFile` are “overlay-aware”

When `piton` is used in the class `beamer`, the environment `{Piton}` and the command `\PitonInputFile` accept the optional argument `<...>` of Beamer for the overlays which are involved.

For example, it's possible to write:

```
\begin{Piton}<2-5>
...
\end{Piton}
```

and

```
\PitonInputFile<2-5>{my_file.py}
```

²⁵Remind that for an environment `{frame}` of Beamer using the key `fragile`, the instruction `\end{frame}` must be alone on a single line (except for any leading whitespace).

²⁶The extension `piton` detects the class `beamer` and the package `beamerarticle` if it is loaded previously but, if needed, it's also possible to activate that mechanism with the key `beamer` provided by `piton` at load-time: `\usepackage[beamer]{piton}`

6.8.2 Commands of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following commands of `beamer` (classified upon their number of arguments) are automatically detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`):

- no mandatory argument : `\pause`²⁷. ;
- one mandatory argument : `\action`, `\alert`, `\invisible`, `\only`, `\uncover` and `\visible` ;
It's possible to add new commands to that list with the key `detected-beamer-commands` (the names of the commands must *not* be preceded by a backslash).
- two mandatory arguments : `\alt` ;
- three mandatory arguments : `\temporal`.

These commands must be used preceded and following by a space. In the mandatory arguments of these commands, the braces must be balanced. However, the braces included in short strings²⁸ of Python are not considered.

Regarding the functions `\alt` and `\temporal` there should be no carriage returns in the mandatory arguments of these functions.

Here is a complete example of file:

```
\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def string_of_list(l):
    """Convert a list of numbers in string"""
    \only<2->{s = "{" + str(l[0])}
    \only<3->{for x in l[1:]: s = s + "," + str(x)}
    \only<4->{s = s + "}"}
    return s
\end{Piton}
\end{frame}
\end{document}
```

In the previous example, the braces in the Python strings "{" and "}" are correctly interpreted (without any escape character).

6.8.3 Environments of Beamer allowed in {Piton} and \PitonInputFile

When `piton` is used in the class `beamer`, the following environments of Beamer are directly detected in the environments `{Piton}` (and in the listings processed by `\PitonInputFile`): `{actionenv}`, `{alertenv}`, `{invisibleenv}`, `{onlyenv}`, `{uncoverenv}` and `{visibleenv}`.

It's possible to add new environments to that list with the key `detected-beamer-environments`.

However, there is a restriction: these environments must contain only *whole lines of Python code* in their body. The instructions `\begin{...}` and `\end{...}` must be alone on their lines.

Here is an example:

²⁷One should remark that it's also possible to use the command `\pause` in a "LaTeX comment", that is to say by writing `#> \pause`. By this way, if the Python code is copied, it's still executable by Python

²⁸The short strings of Python are the strings delimited by characters `'` or the characters `"` and not `'''` nor `"""`. In Python, the short strings can't extend on several lines.

```

\documentclass{beamer}
\usepackage{piton}
\begin{document}
\begin{frame}[fragile]
\begin{Piton}
def square(x):
    """Compute the square of its argument"""
    \begin{uncoverenv}<2>
    return x*x
    \end{uncoverenv}
\end{Piton}
\end{frame}
\end{document}

```

Remark concerning the command `\alert` and the environment `{alertenv}` of Beamer

Beamer provides an easy way to change the color used by the environment `{alertenv}` (and by the command `\alert` which relies upon it) to highlight its argument. Here is an example:

```
\setbeamercolor{alerted text}{fg=blue}
```

However, when used inside an environment `{Piton}`, such tuning will probably not be the best choice because `piton` will, by design, change (most of the time) the color the different elements of text. One may prefer an environment `{alertenv}` that will change the background color for the elements to be highlighted.

Here is a code that will do that job and add a yellow background. That code uses the command `\@highLight` of `lua-ul` (that extension requires also the package `luacolor`).

```

\setbeamercolor{alerted text}{bg=yellow!50}
\makeatletter
\AddToHook{env/Piton/begin}
{ \renewenvironment<>{alertenv}{\only#1{\@highLight[alerted text.bg]}}{}}
\makeatother

```

That code redefines locally the environment `{alertenv}` within the environments `{Piton}` (we recall that the command `\alert` relies upon that environment `{alertenv}`).

6.9 Footnotes in the environments of `piton`

If you want to put footnotes in an environment `{Piton}` or (or, more unlikely, in a listing produced by `\PitonInputFile`), you can use a pair `\footnotemark`–`\footnotetext`.

However, it's also possible to extract the footnotes with the help of the package `footnote` or the package `footnotehyper`.

If `piton` is loaded with the option `footnote` (with `\usepackage[footnote]{piton}` or with `\PassOptionsToPackage`), the package `footnote` is loaded (if it is not yet loaded) and it is used to extract the footnotes.

If `piton` is loaded with the option `footnotehyper`, the package `footnotehyper` is loaded (if it is not yet loaded) and it is used to extract footnotes.

Caution: The packages `footnote` and `footnotehyper` are incompatible. The package `footnotehyper` is the successor of the package `footnote` and should be used preferently. The package `footnote` has some drawbacks, in particular: it must be loaded after the package `xcolor` and it is not perfectly compatible with `hyperref`.

Important remark : If you use Beamer, you should know that Beamer has its own system to extract the footnotes. Therefore, `piton` must be loaded in that class without the option `footnote` nor the option `footnotehyper`.

By default, in an environment `{Piton}`, a command `\footnote` may appear only within a “LaTeX comment”. But it’s also possible to add the command `\footnote` to the list of the “*detected-commands*” (cf. part 6.7.3, p. 23).

In this document, the package `piton` has been loaded with the option `footnotehyper` and we added the command `\footnote` to the list of the “*detected-commands*” with the following instruction in the preamble of the LaTeX document.

```
\PitonOptions{detected-commands = footnote}

\PitonOptions{background-color=gray!15}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)29
    elif x > 1:
        return pi/2 - arctan(1/x)30
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

If an environment `{Piton}` is used in an environment `{minipage}` of LaTeX, the notes are composed, of course, at the foot of the environment `{minipage}`. Recall that such `{minipage}` can’t be broken by a page break.

```
\PitonOptions{background-color=gray!15}
\emphase\begin{minipage}{\linewidth}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)\footnote{First recursive call.}
    elif x > 1:
        return pi/2 - arctan(1/x)\footnote{Second recursive call.}
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
\end{minipage}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)a
    elif x > 1:
        return pi/2 - arctan(1/x)b
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

^aFirst recursive call.

^bSecond recursive call.

²⁹First recursive call.

³⁰Second recursive call.

6.10 Tabulations

Even though it's probably recommended to indent the informatics listings with spaces and not tabulations³¹, `piton` accepts the characters of tabulation (that is to say the characters U+0009) at the beginning of the lines. Each character U+0009 is replaced by n spaces. The initial value of n is 4 but it's possible to change it with the key `tab-size` of `\PitonOptions`.

There exists also a key `tabs-auto-gobble` which computes the minimal value n of the number of consecutive characters U+0009 beginning each (non empty) line of the environment `{Piton}` and applies `gobble` with that value of n (before replacement of the tabulations by spaces, of course). Hence, that key is similar to the key `auto-gobble` but acts on U+0009 instead of U+0020 (spaces). The key `env-gobble` is not compatible with the tabulations.

7 API for the developers

The L3 variable `\l_piton_language_str` contains the name of the current language of `piton` (in lower case).

The extension `piton` provides a Lua function `piton.get_last_code` without argument which returns the code in the latest environment of `piton`.

- The carriage returns (which are present in the initial environment) appears as characters `\r` (i.e. U+000D).
- The code returned by `piton.get_last_code()` takes into account the potential application of a key `gobble`, `auto-gobble` or `env-gobble` (cf. p. 4).
- The extra formatting elements added in the code are deleted in the code returned by `piton.get_last_code()`. That concerns the LaTeX commands declared by the key `detected-commands` and its variants (cf. part 6.7.3) and the elements inserted by the mechanism “`escape`” (cf. part 6.7.4).
- `piton.get_last_code` is a Lua function and not a Lua string: the treatments outlined above are executed when the function is called. Therefore, it might be judicious to store the value returned by `piton.get_last_code()` in a variable of Lua if it will be used several times.

For an example of use, see the part concerning `pyluatex`, part 8.5, p. 36.

8 Examples

8.1 An example of tuning of the styles

The graphical styles have been presented in the section 4.2, p. 7.

We present now an example of tuning of these styles adapted to the documents in black and white. That tuning uses the command `\highLight` of `lua-ul` (that package requires itself the package `luacolor`).

```
\SetPitonStyle
{
  Number = ,
  String = \itshape ,
  String.Doc = \color{gray} \slshape ,
  Operator = ,
  Operator.Word = \bfseries ,
  Name.Builtin = ,
  Name.Function = \bfseries \highLight[gray!20] ,
  Comment = \color{gray} ,
```

³¹For the language Python, see the note PEP 8.

```

Comment.LaTeX = \normalfont \color{gray},
Keyword = \bfseries ,
Name.Namespace = ,
Name.Class = ,
Name.Type = ,
InitialValues = \color{gray}
}

```

In that tuning, many values given to the keys are empty: that means that the corresponding style won't insert any formatting instruction (the element will be composed in the standard color, usually in black, etc.). Nevertheless, those entries are mandatory because the initial value of those keys in `piton` is *not* empty.

```

from math import pi

def arctan(x,n=10):
    """Compute the mathematical value of arctan(x)

    n is the number of terms in the sum
    """
    if x < 0:
        return -arctan(-x) # recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)
        (we have used that arctan(x) + arctan(1/x) = π/2 for x > 0)
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s

```

8.2 Line numbering

We remind that it's possible to have an automatic numbering of the lines in the informatic listings by using the key `line-numbers` (used without value).

By default, the numbers of the lines are composed by `piton` in an overlapping position on the left (by using internally the command `\llap` of LaTeX).

In order to avoid that overlapping, it's possible to use the option `left-margin=auto` which will insert automatically a margin adapted to the numbers of lines that will be written (that margin is larger when the numbers are greater than 10).

```

\PitonOptions{background-color=gray!15, left-margin = auto, line-numbers}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> (recursive call)
    elif x > 1:
        return pi/2 - arctan(1/x) #> (other recursive call)
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}

```

```

1 def arctan(x,n=10):
2     if x < 0:
3         return -arctan(-x)          (recursive call)
4     elif x > 1:
5         return pi/2 - arctan(1/x) (other recursive call)
6     else:
7         return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )

```

8.3 Formatting of the LaTeX comments

It's possible to modify the style `Comment.LaTeX` (with `\SetPitonStyle`) in order to display the LaTeX comments (which begin with `#>`) aligned on the right margin.

```
\PitonOptions{background-color=gray!15}
\SetPitonStyle{Comment.LaTeX = \hfill \normalfont\color{gray}}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> other recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        return sum( (-1)**k/(2*k+1)*x**(2*k+1) for k in range(n) )
```

It's also possible to display these LaTeX comments in a kind of second column by limiting the width of the Python code with the key `width`.

```
\PitonOptions{background-color=gray!15, width=9cm}
\NewDocumentCommand{\MyLaTeXCommand}{m}{\hfill \normalfont\itshape\rlap{\quad #1}}
\SetPitonStyle{Comment.LaTeX = \MyLaTeXCommand}
\begin{Piton}
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x) #> recursive call
    elif x > 1:
        return pi/2 - arctan(1/x) #> another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
\end{Piton}
```

```
def arctan(x,n=10):
    if x < 0:
        return -arctan(-x)          recursive call
    elif x > 1:
        return pi/2 - arctan(1/x)   another recursive call
    else:
        s = 0
        for k in range(n):
            s += (-1)**k/(2*k+1)*x**(2*k+1)
        return s
```

8.4 Use with tcolorbox

The key `tcolorbox` of `piton` has been presented at the page 13.

If, when that key is used, we wish to customize the graphical box created by `tcolorbox` (with the keys provided by `tcolorbox`), we should use the command `\tcbsset` provided by `tcolorbox`. In order to

limit the scope of the settings done by that command, the best way is to create a new environment with the dedicated command `\NewPitonEnvironment` (cf. p. 9). That environment will contain the settings done by `piton` (with `\PitonOptions`) and those done by `tcolorbox` (with `\tcbset`).

Here is an example of such environment `{Python}` with a colored column on the left for the numbers of lines. That example requires the library `skins` of `tcolorbox` to be loaded in the preamble of the LaTeX document with the instruction `\tcbuselibrary{skins}` (in order to be able to use the key `enhanced`).

```
\NewPitonEnvironment{Python}{m}
{%
  \PitonOptions
  {
    tcolorbox,
    splittable=3,
    width=min,
    line-numbers,          % activate the numbers of lines
    line-numbers =        % tuning for the numbers of lines
    {
      format = \footnotesize\color{white}\sffamily ,
      sep = 2.5mm
    }
  }%
  \tcbset
  {
    enhanced,
    title=#1,
    fonttitle=\sffamily,
    left = 6mm,
    top = 0mm,
    bottom = 0mm,
    overlay=
    {%
      \begin{tcbclipinterior}%
        \fill[gray!80]
          (frame.south west) rectangle
          ([xshift=6mm]frame.north west);
      \end{tcbclipinterior}%
    }
  }
}
```

In the following example of use, we have illustrated the fact that it is possible to impose a break of page in such environment with `\newpage{}` if we have required the detection of the LaTeX command `\newpage` with the key `vertical-detected-commands` (cf. p. 23) in the preamble of the LaTeX document.

Remark that we must use `\newpage{}` and not `\newpage` because the LaTeX commands detected by `piton` are meant to be commands with one argument (between curly braces).

```
\PitonOptions{vertical-detected-commands = newpage} % in the preamble
```

```
\begin{Python}{My example}
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
```

```

    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x
def square(x):
    """Computes the square of x"""
    return x*x \newpage{}
def square(x):
    """Computes the square of x"""
    return x*x
...
def square(x):
    """Computes the square of x"""
    return x*x
\end{Python}

```

My example

```

1 def square(x):
2     """Computes the square of x"""
3     return x*x
4 def square(x):
5     """Computes the square of x"""
6     return x*x
7 def square(x):
8     """Computes the square of x"""
9     return x*x
10 def square(x):
11     """Computes the square of x"""
12     return x*x

```

```

13 def square(x):
14     """Computes the square of x"""
15     return x*x
16 def square(x):
17     """Computes the square of x"""
18     return x*x
19 def square(x):
20     """Computes the square of x"""
21     return x*x
22 def square(x):
23     """Computes the square of x"""
24     return x*x
25 def square(x):
26     """Computes the square of x"""
27     return x*x
28 def square(x):
29     """Computes the square of x"""
30     return x*x
31 def square(x):
32     """Computes the square of x"""
33     return x*x
34 def square(x):
35     """Computes the square of x"""
36     return x*x
37 def square(x):
38     """Computes the square of x"""
39     return x*x
40 def square(x):
41     """Computes the square of x"""
42     return x*x
43 def square(x):
44     """Computes the square of x"""
45     return x*x
46 def square(x):
47     """Computes the square of x"""
48     return x*x
49 def square(x):
50     """Computes the square of x"""
51     return x*x
52 def square(x):
53     """Computes the square of x"""
54     return x*x
55 def square(x):
56     """Computes the square of x"""
57     return x*x
58 def square(x):
59     """Computes the square of x"""
60     return x*x
61 def square(x):
62     """Computes the square of x"""
63     return x*x
64 def square(x):
65     """Computes the square of x"""
66     return x*x
67 def square(x):
68     """Computes the square of x"""
69     return x*x

```

```

70 def square(x):
71     """Computes the square of x"""
72     return x*x
73 def square(x):
74     """Computes the square of x"""
75     return x*x
76 def square(x):
77     """Computes the square of x"""
78     return x*x
79 def square(x):
80     """Computes the square of x"""
81     return x*x
82 def square(x):
83     """Computes the square of x"""
84     return x*x

```

8.5 Use with pyluatex

The package `pyluatex` is an extension which allows the execution of some Python code from `lualatex` (as long as Python is installed on the machine and that the compilation is done with `lualatex` and `--shell-escape`).

Here is, for example, an environment `{PitonExecute}` which formats a Python listing (with `piton`) but also displays the output of the execution of the code with Python.

```

\NewPitonEnvironment{PitonExecute}{!0{}}
{\PitonOptions{#1}}
{\begin{center}
  \directlua{pyluatex.execute(piton.get_last_code(), false, true, false, true)}%
  \end{center}
  \ignorespacesafterend}

```

We have used the Lua function `piton.get_last_code` provided in the API of `piton` : cf. part 7, p. 30.

This environment `{PitonExecute}` takes in as optional argument (between square brackets) the options of the command `\PitonOptions`.

9 The styles for the different computer languages

9.1 The language Python

In `piton`, the default language is Python. If necessary, it's possible to come back to the language Python with `\PitonOptions{language=Python}`.

The initial settings done by `piton` in `piton.sty` are inspired by the style `manni` of `Pygments`, as applied by `Pygments` to the language Python.³²

Style	Use
Number	the numbers
String.Short	the short strings (entre ' ou ")
String.Long	the long strings (entre ' ' ou " ") excepted the doc-strings (governed by <code>String.Doc</code>)
String	that key fixes both <code>String.Short</code> et <code>String.Long</code>
String.Doc	the doc-strings (only with " " following PEP 257)
String.Interpol	the syntactic elements of the fields of the f-strings (that is to say the characters { et }); that style inherits for the styles <code>String.Short</code> and <code>String.Long</code> (according the kind of string where the interpolation appears)
Interpol.Inside	the content of the interpolations in the f-strings (that is to say the elements between { and }); if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Operator	the following operators: <code>!= == << >> - ~ + / * % = < > & . @</code>
Operator.Word	the following operators: <code>in, is, and, or</code> et <code>not</code>
Name.Builtin	almost all the functions predefined by Python
Name.Decorator	the decorators (instructions beginning by <code>@</code>)
Name.Namespace	the name of the modules
Name.Class	the name of the Python classes defined by the user <i>at their point of definition</i> (with the keyword <code>class</code>)
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>def</code>)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is <code>\PitonStyle{Identifier}</code> and, therefore, the names of that functions are formatted like the identifiers).
Exception	les exceptions prédéfinies (ex.: <code>SyntaxError</code>)
InitialValues	the initial values (and the preceding symbol <code>=</code>) of the optional arguments in the definitions of functions; if the final user has not set that key, those elements will be formatted by <code>piton</code> as done for any Python code.
Comment	the comments beginning with <code>#</code>
Comment.LaTeX	the comments beginning with <code>#></code> , which are composed by <code>piton</code> as LaTeX code (merely named "LaTeX comments" in this document)
Keyword.Constant	<code>True, False</code> et <code>None</code>
Keyword	the following keywords: <code>assert, break, case, continue, del, elif, else, except, exec, finally, for, from, global, if, import, in, lambda, non local, pass, raise, return, try, while, with, yield</code> et <code>yield from</code> .
Identifier	the identifiers.

³²See: <https://pygments.org/styles/>. Remark that, by default, `Pygments` provides for its style `manni` a colored background whose color is the HTML color `#F0F3F3`. It's possible to have the same color in `{Piton}` with the instruction `\PitonOptions{background-color = [HTML]{F0F3F3}}`.

9.2 The language OCaml

It's possible to switch to the language OCaml with the key `language: language = OCaml`.

Style	Use
Number	the numbers
String.Short	the characters (between ')
String.Long	the strings, between " but also the <i>quoted-strings</i>
String	that key fixes both <code>String.Short</code> and <code>String.Long</code>
Operator	les opérateurs, en particulier +, -, /, *, @, !=, ==, &&
Operator.Word	les opérateurs suivants : <code>asr</code> , <code>land</code> , <code>lor</code> , <code>lsl</code> , <code>lxor</code> , <code>mod</code> et <code>or</code>
Name.Builtin	les fonctions <code>not</code> , <code>incr</code> , <code>decr</code> , <code>fst</code> et <code>snd</code>
Name.Type	the name of a type of OCaml
Name.Field	the name of a field of a module
Name.Constructor	the name of the constructors of types (which begins by a capital)
Name.Module	the name of the modules
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword <code>let</code>)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is <code>\PitonStyle{Identifier}</code> and, therefore, the names of that functions are formatted like the identifiers).
Exception	the predefined exceptions (eg : <code>End_of_File</code>)
TypeParameter	the parameters of the types
Comment	the comments, between (* et *); these comments may be nested
Keyword.Constant	<code>true</code> et <code>false</code>
Keyword	the following keywords: <code>assert</code> , <code>as</code> , <code>done</code> , <code>downto</code> , <code>do</code> , <code>else</code> , <code>exception</code> , <code>for</code> , <code>function</code> , <code>fun</code> , <code>if</code> , <code>lazy</code> , <code>match</code> , <code>mutable</code> , <code>new</code> , <code>of</code> , <code>private</code> , <code>raise</code> , <code>then</code> , <code>to</code> , <code>try</code> , <code>virtual</code> , <code>when</code> , <code>while</code> and <code>with</code>
Keyword.Governing	the following keywords: <code>and</code> , <code>begin</code> , <code>class</code> , <code>constraint</code> , <code>end</code> , <code>external</code> , <code>functor</code> , <code>include</code> , <code>inherit</code> , <code>initializer</code> , <code>in</code> , <code>let</code> , <code>method</code> , <code>module</code> , <code>object</code> , <code>open</code> , <code>rec</code> , <code>sig</code> , <code>struct</code> , <code>type</code> and <code>val</code> .
Identifier	the identifiers.

9.3 The language C (and C++)

It's possible to switch to the language C with the key `language: language = C`.

Style	Use
Number	the numbers
String.Long	the strings (between ")
String.Interpol	the elements %d, %i, %f, %c, etc. in the strings; that style inherits from the style String.Long
Operator	the following operators : != == << >> - ~ + / * % = < > & . @
Name.Type	the following predefined types: bool, char, char16_t, char32_t, double, float, int, int8_t, int16_t, int32_t, int64_t, long, short, signed, unsigned, void et wchar_t
Name.Builtin	the following predefined functions: printf, scanf, malloc, sizeof and alignof
Name.Class	le nom des classes au moment de leur définition, c'est-à-dire après le mot-clé class
Name.Function	the name of the Python functions defined by the user <i>at their point of definition</i> (with the keyword let)
UserFunction	the name of the Python functions previously defined by the user (the initial value of that parameter is \PitonStyle{Identifier} and, therefore, the names of that functions are formatted like the identifiers).
Preproc	the instructions of the preprocessor (beginning par #)
Comment	the comments (beginning by // or between /* and */)
Comment.LaTeX	the comments beginning by //> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
Keyword.Constant	default, false, NULL, nullptr and true
Keyword	the following keywords: alignas, asm, auto, break, case, catch, class, constexpr, const, continue, decltype, do, else, enum, extern, for, goto, if, noexcept, private, public, register, restricted, try, return, static, static_assert, struct, switch, thread_local, throw, typedef, union, using, virtual, volatile and while
Identifier	the identifiers.

9.4 The language SQL

It's possible to switch to the language SQL with the key `language: language = SQL`.

Style	Use
Number	the numbers
String.Long	the strings (between ' and not " because the elements between " are names of fields and formatted with <code>Name.Field</code>)
Operator	the following operators : = != <> >= > < <= * + /
Name.Table	the names of the tables
Name.Field	the names of the fields of the tables
Name.Builtin	the following built-in functions (their names are <i>not</i> case-sensitive): avg, count, char_length, concat, curdate, current_date, date_format, day, lower, ltrim, max, min, month, now, rank, round, rtrim, substring, sum, upper and year.
Comment	the comments (beginning by -- or between /* and */)
Comment.LaTeX	the comments beginning by --> which are composed by piton as LaTeX code (merely named "LaTeX comments" in this document)
Keyword	the following keywords (their names are <i>not</i> case-sensitive): abort, action, add, after, all, alter, always, analyze, and, as, asc, attach, autoincrement, before, begin, between, by, cascade, case, cast, check, collate, column, commit, conflict, constraint, create, cross, current, current_date, current_time, current_timestamp, database, default, deferrable, deferred, delete, desc, detach, distinct, do, drop, each, else, end, escape, except, exclude, exclusive, exists, explain, fail, filter, first, following, for, foreign, from, full, generated, glob, group, groups, having, if, ignore, immediate, in, index, indexed, initially, inner, insert, instead, intersect, into, is, isnull, join, key, last, left, like, limit, match, materialized, natural, no, not, nothing, notnull, null, nulls, of, offset, on, or, order, others, outer, over, partition, plan, pragma, preceding, primary, query, raise, range, recursive, references, regexp, reindex, release, rename, replace, restrict, returning, right, rollback, row, rows, savepoint, select, set, table, temp, temporary, then, ties, to, transaction, trigger, unbounded, union, unique, update, using, vacuum, values, view, virtual, when, where, window, with, without

It's possible to automatically capitalize the keywords by modifying locally for the language SQL the style `Keywords`.

```
\SetPitonStyle[SQL]{Keywords = \bfseries \MakeUppercase}
```

9.5 The languages defined by `\NewPitonLanguage`

The command `\NewPitonLanguage`, which defines new computer languages with the syntax of the extension listings, has been described p. 10.

All the languages defined by the command `\NewPitonLanguage` use the same styles.

Style	Use
Number	the numbers
String.Long	the strings defined in <code>\NewPitonLanguage</code> by the key <code>morestring</code>
Comment	the comments defined in <code>\NewPitonLanguage</code> by the key <code>morecomment</code>
Comment.LaTeX	the comments which are composed by <code>piton</code> as LaTeX code (merely named “LaTeX comments” in this document)
Keyword	the keywords defined in <code>\NewPitonLanguage</code> by the keys <code>morekeywords</code> and <code>moretexcs</code> (and also the key <code>sensitive</code> which specifies whether the keywords are case-sensitive or not)
Directive	the directives defined in <code>\NewPitonLanguage</code> by the key <code>moredirectives</code>
Tag	the “tags” defined by the key <code>tag</code> (the lexical units detected within the tag will also be formatted with their own style)
Identifier	the identifiers.

Here is for example a definition for the language HTML, obtained with a slight adaptation of the definition done by listings (file `lstlang1.sty`).

```
\NewPitonLanguage{HTML}%
{morekeywords={A, ABBR, ACRONYM, ADDRESS, APPLET, AREA, B, BASE, BASEFONT, %
  BDO, BIG, BLOCKQUOTE, BODY, BR, BUTTON, CAPTION, CENTER, CITE, CODE, COL, %
  COLGROUP, DD, DEL, DFN, DIR, DIV, DL, DOCTYPE, DT, EM, FIELDSET, FONT, FORM, %
  FRAME, FRAMESET, HEAD, HR, H1, H2, H3, H4, H5, H6, HTML, I, IFRAME, IMG, INPUT, %
  INS, ISINDEX, KBD, LABEL, LEGEND, LH, LI, LINK, LISTING, MAP, META, MENU, %
  NOFRAMES, NOSCRIPT, OBJECT, OPTGROUP, OPTION, P, PARAM, PLAINTEXT, PRE, %
  OL, Q, S, SAMP, SCRIPT, SELECT, SMALL, SPAN, STRIKE, STRING, STRONG, STYLE, %
  SUB, SUP, TABLE, TBODY, TD, TEXTAREA, TFOOT, TH, THEAD, TITLE, TR, TT, U, UL, %
  VAR, XMP, %
  accesskey, action, align, alink, alt, archive, axis, background, bgcolor, %
  border, cellpadding, cellspacing, charset, checked, cite, class, classid, %
  code, codebase, codetype, color, cols, colspan, content, coords, data, %
  datetime, defer, disabled, dir, event, error, for, frameborder, headers, %
  height, href, hreflang, hspace, http-equiv, id, ismap, label, lang, link, %
  longdesc, marginwidth, marginheight, maxlength, media, method, multiple, %
  name, nohref, noresize, noshade, nowrap, onblur, onchange, onclick, %
  ondblclick, onfocus, onkeydown, onkeypress, onkeyup, onload, onmousedown, %
  profile, readonly, onmousemove, onmouseout, onmouseover, onmouseup, %
  onselect, onunload, rel, rev, rows, rowspan, scheme, scope, scrolling, %
  selected, shape, size, src, standby, style, tabindex, text, title, type, %
  units, usemap, valign, value, valuetype, vlink, vspace, width, xmlns}, %
tag=<>,%
alsoletter = - ,%
sensitive=f,%
morestring=[d] ",
}
```

9.6 The language “minimal”

It’s possible to switch to the language “minimal” with the key `language: language = minimal`.

Style	Usage
<code>Number</code>	the numbers
<code>String</code>	the strings (between <code>"</code>)
<code>Comment</code>	the comments (which begin with <code>#</code>)
<code>Comment.LaTeX</code>	the comments beginning with <code>#></code> , which are composed by <code>piton</code> as LaTeX code (merely named “LaTeX comments” in this document)
<code>Identifier</code>	the identifiers.

That language is provided for the final user who might wish to add keywords in that language (with the command `\SetPitonIdentifier`: cf. 6.6, p. 21) in order to create, for example, a language for pseudo-code.

9.7 The language “verbatim”

It’s possible to switch to the language “verbatim” with the key `language: language = verbatim`.

Style	Usage
<code>None...</code>	

The language `verbatim` doesn’t provide any style and, thus, does not do any syntactic formatting. However, it’s possible to use the mechanism `detected-commands` (cf. part 6.7.3, p. 23) and the detection of the commands and environments of Beamer.

10 Implementation

The development of the extension `piton` is done on the following GitHub depot:
<https://github.com/fpantigny/piton>

10.1 Introduction

The main job of the package `piton` is to take in as input a Python listing and to send back to LaTeX as output that code *with interlaced LaTeX instructions of formatting*.

In fact, all that job is done by a LPEG called `python`. That LPEG, when matched against the string of a Python listing, returns as capture a Lua table containing data to send to LaTeX. The only thing to do after will be to apply `tex.tprint` to each element of that table.³³

Consider, for example, the following Python code:

```
def parity(x):  
    return x%2
```

The capture returned by the lpeg `python` against that code is the Lua table containing the following elements :

```
{ "\\_\\_piton_begin_line:" }a  
{ "\\PitonStyle{Keyword}{ " }b  
{ luatexbase.catcodetables.CatcodeTableOtherc, "def" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "\\PitonStyle{Name.Function}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "parity" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, "(" }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ luatexbase.catcodetables.CatcodeTableOther, ")" }  
{ luatexbase.catcodetables.CatcodeTableOther, ":" }  
{ "\\_\\_piton_end_line: \\_\\_piton_newline: \\_\\_piton_begin_line:" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ "\\PitonStyle{Keyword}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "return" }  
{ "}}" }  
{ luatexbase.catcodetables.CatcodeTableOther, " " }  
{ luatexbase.catcodetables.CatcodeTableOther, "x" }  
{ "\\PitonStyle{Operator}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "&" }  
{ "}}" }  
{ "\\PitonStyle{Number}{ " }  
{ luatexbase.catcodetables.CatcodeTableOther, "2" }  
{ "}}" }  
{ "\\_\\_piton_end_line:" }
```

^aEach line of the Python listings will be encapsulated in a pair: `__begin_line: – __end_line:`. The token `__end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `__begin_line:`. Both tokens `__begin_line:` and `__end_line:` will be nullified in the command `\piton` (since there can't be lines breaks in the argument of a command `\piton`).

^bThe lexical elements of Python for which we have a `piton` style will be formatted via the use of the command `\PitonStyle`. Such an element is typeset in LaTeX via the syntax `{\PitonStyle{style}{...}}` because the instructions inside an `\PitonStyle` may be both semi-global declarations like `\bfseries` and commands with one argument like `\fbox`.

^c`luatexbase.catcodetables.CatcodeTableOther` is a mere number which corresponds to the “catcode table” whose all characters have the catcode “other” (which means that they will be typeset by LaTeX verbatim).

³³Recall that `tex.tprint` takes in as argument a Lua table whose first component is a “catcode table” and the second element a string. The string will be sent to LaTeX with the regime of catcodes specified by the catcode table. If no catcode table is provided, the standard catcodes of LaTeX will be used.

We give now the LaTeX code which is sent back by Lua to TeX (we have written on several lines for legibility but no character `\r` will be sent to LaTeX). The characters which are greyed-out are sent to LaTeX with the catcode “other” (=12). All the others characters are sent with the regime of catcodes of L3 (as set by `\ExplSyntaxOn`)

```
\__piton_begin_line:{\PitonStyle{Keyword}{def}}
\_{\PitonStyle{Name.Function}{parity}}(x):\__piton_end_line:\__piton_newline:
\__piton_begin_line:_{\PitonStyle{Keyword}{return}}
\_{\PitonStyle{Operator}{%}}{\PitonStyle{Number}{2}}\__piton_end_line:
```

10.2 The L3 part of the implementation

10.2.1 Declaration of the package

```
1 <*STY>
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesExplPackage
4   {piton}
5   {\PitonFileDate}
6   {\PitonFileVersion}
7   {Highlight informatic listings with LPEG on LuaLaTeX}
8 \msg_new:nnn { piton } { latex-too-old }
9   {
10     Your~LaTeX~release~is~too~old. \\
11     You~need~at~least~the~version~of~2023-11-01
12   }
13 \IfFormatAtLeastTF
14   { 2023-11-01 }
15   { }
16   { \msg_fatal:nn { piton } { latex-too-old } }
```

The command `\text` provided by the package `amstext` will be used to allow the use of the command `\pion{...}` (with the standard syntax) in mathematical mode.

```
17 \RequirePackage { amstext }

18 \cs_new_protected:Npn \@@_error:n { \msg_error:nn { piton } }
19 \cs_new_protected:Npn \@@_warning:n { \msg_warning:nn { piton } }
20 \cs_new_protected:Npn \@@_warning:nn { \msg_warning:nnn { piton } }
21 \cs_new_protected:Npn \@@_error:nn { \msg_error:nnn { piton } }
22 \cs_new_protected:Npn \@@_error:nnn { \msg_error:nnnn { piton } }
23 \cs_new_protected:Npn \@@_fatal:n { \msg_fatal:nn { piton } }
24 \cs_new_protected:Npn \@@_fatal:nn { \msg_fatal:nnn { piton } }
25 \cs_new_protected:Npn \@@_msg_new:nn { \msg_new:nnn { piton } }
```

With Overleaf, by default, a document is compiled in non-stop mode. When there is an error, there is no way to the user to use the key `H` in order to have more information. That’s why we decide to put that piece of information (for the messages with such information) in the main part of the message when the key `messages-for-Overleaf` is used (at load-time).

```
26 \cs_new_protected:Npn \@@_msg_new:nnn #1 #2 #3
27   {
28     \bool_if:NTF \g_@@_messages_for_Overleaf_bool
29       { \msg_new:nnn { piton } { #1 } { #2 } { #3 } }
30       { \msg_new:nnnn { piton } { #1 } { #2 } { #3 } }
31   }
```

We also create commands which will generate usually an error but only a warning on Overleaf. The argument is given by curryfication.

```
32 \cs_new_protected:Npn \@@_error_or_warning:n
33   { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:n \@@_error:n }
34 \cs_new_protected:Npn \@@_error_or_warning:nn
```

```

35 { \bool_if:NTF \g_@@_messages_for_Overleaf_bool \@@_warning:nn \@@_error:nn }

```

We try to detect whether the compilation is done on Overleaf. We use `\c_sys_jobname_str` because, with Overleaf, the value of `\c_sys_jobname_str` is always “output”.

```

36 \bool_new:N \g_@@_messages_for_Overleaf_bool
37 \bool_gset:Nn \g_@@_messages_for_Overleaf_bool
38 {
39     \str_if_eq_p:on \c_sys_jobname_str { _region_ } % for Emacs
40     || \str_if_eq_p:on \c_sys_jobname_str { output } % for Overleaf
41 }

42 \@@_msg_new:nn { LuaLaTeX~mandatory }
43 {
44     LuaLaTeX~is~mandatory.\\
45     The~package~'piton'~requires~the~engine~LuaLaTeX.\\

```

The flag `\g_@@_footnote_bool` is raised and so, we will only have to test `\g_@@_footnote_bool` in order to know if we have to insert an environment `{savenotes}`.

10.2.2 Parameters and technical definitions

```

154 \tl_new:N \l_@@_body_tl
155 % \end{macrocode}
156 %
157 % The content of an environment such as |{Piton}| will be composed first in the
158 % following box, but that box be \emph{unvboxed} at the end.
159 % \begin{macrocode}
160 \box_new:N \g_@@_output_box
161 \box_new:N \l_@@_line_box

```

The following string will contain the name of the computer language considered (the initial value is `python`).

```

162 \str_new:N \l_piton_language_str
163 \str_set:Nn \l_piton_language_str { python }

```

Each time an environment of `piton` is used, the informatic code in the body of that environment will be stored in the following global string.

```

164 \tl_new:N \g_piton_last_code_tl

```

The following parameter corresponds to the key `path` (which is the path used to include files by `\PitonInputFile`). Each component of that sequence will be a string (type `str`).

```

165 \seq_new:N \l_@@_path_seq

```

The following parameter corresponds to the key `path-write` (which is the path used when writing files from listings inserted in the environments of `piton` by use of the key `write`).

```

166 \str_new:N \l_@@_path_write_str

```

The following parameter corresponds to the key `tcolorbox`.

```

167 \bool_new:N \l_@@_tcolorbox_bool
168 % \end{macrocode}
169 %
170 % \medskip
171 % The following parameter corresponds to the key |box|.
172 % \begin{macrocode}
173 \str_new:N \l_@@_box_str
174 % \end{macrocode}
175 %
176 % \medskip

```

```

177 % In order to have a better control over the keys.
178 % \begin{macrocode}
179 \bool_new:N \l_@@_in_PitonOptions_bool
180 \bool_new:N \l_@@_in_PitonInputFile_bool

```

The following parameter corresponds to the key `font-command`.

```

181 \tl_new:N \l_@@_font_command_tl
182 \tl_set:Nn \l_@@_font_command_tl { \ttfamily }

```

We will compute (with Lua) the numbers of lines of the listings (or *chunks* of listings when `split-on-empty-lines` is in force) and store it in the following counter.

```

183 \int_new:N \l_@@_nb_lines_int

```

The same for the number of non-empty lines of the listings.

```

184 \int_new:N \l_@@_nb_non_empty_lines_int

```

The following counter will be used to count the lines during the composition. It will take into account all the lines, empty or not empty. It won't be used to print the numbers of the lines but will be used to allow or disallow line breaks (when `splittable` is in force) and for the color of the background (when `background-color` is used with a *list* of colors).

```

185 \int_new:N \g_@@_line_int

```

The following counter corresponds to the key `splittable` of `\PitonOptions`. If the value of `\l_@@_splittable_int` is equal to n , then no line break can occur within the first n lines or the last n lines of a listing (or a *chunk* of listings when the key `split-on-empty-lines` is in force).

```

186 \int_new:N \l_@@_splittable_int

```

An initial value of `splittable` equal to 100 is equivalent to say that the environments `{Piton}` are unbreakable.

```

187 \int_set:Nn \l_@@_splittable_int { 100 }

```

When the key `split-on-empty-lines` will be in force, then the following token list will be inserted between the chunks of code (the informatic code provided by the final user is split in chunks on the empty lines in the code).

```

188 \tl_new:N \l_@@_split_separation_tl
189 \tl_set:Nn \l_@@_split_separation_tl
190 { \vspace { \baselineskip } \vspace { -1.25pt } }

```

That parameter must contain elements to be inserted in *vertical* mode by TeX.

The following string corresponds to the key `background-color` of `\PitonOptions`.

```

191 \clist_new:N \l_@@_bg_color_clist

```

The package `piton` will also detect the lines of code which correspond to the user input in a Python console, that is to say the lines of code beginning with `>>>` and `....`. It's possible, with the key `prompt-background-color`, to require a background for these lines of code (and the other lines of code will have the standard background color specified by `background-color`).

```

192 \tl_new:N \l_@@_prompt_bg_color_tl

```

```

193 \tl_new:N \l_@@_space_in_string_tl

```

The following parameters correspond to the keys `begin-range` and `end-range` of the command `\PitonInputFile`.

```

194 \str_new:N \l_@@_begin_range_str
195 \str_new:N \l_@@_end_range_str

```

The following boolean corresponds to the key `math-comments` (available only in the preamble of the LaTeX document).

```

196 \bool_new:N \g_@@_math_comments_bool

```

The argument of `\PitonInputFile`.

```

197 \str_new:N \l_@@_file_name_str

```

We will count the environments `{Piton}` (and, in fact, also the commands `\PitonInputFile`, despite the name `\g_@@_env_int`).

```
198 \int_new:N \g_@@_env_int
```

The following flag corresponds to the key `print`. The initial value of that parameter will be `true` (and not `false`) since, of course, by default, we want to print the content of the environment `{Piton}`

```
199 \bool_new:N \l_@@_print_bool
200 \bool_set_true:N \l_@@_print_bool
```

The parameter `\l_@@_write_str` corresponds to the key `write`.

```
201 \str_new:N \l_@@_write_str
```

The parameter `\l_@@_join_str` corresponds to the key `join`. In fact, `\l_@@_join_str` won't contain the exact value used the final user but its conversion in "utf16/hex".

```
202 \str_new:N \l_@@_join_str
```

The following boolean corresponds to the key `show-spaces`.

```
203 \bool_new:N \l_@@_show_spaces_bool
```

The following booleans correspond to the keys `break-lines` and `indent-broken-lines`.

```
204 \bool_new:N \l_@@_break_lines_in_Piton_bool
205 \bool_set_true:N \l_@@_break_lines_in_Piton_bool
206 \bool_new:N \l_@@_indent_broken_lines_bool
```

The following token list corresponds to the key `continuation-symbol`.

```
207 \tl_new:N \l_@@_continuation_symbol_tl
208 \tl_set:Nn \l_@@_continuation_symbol_tl { + }
```

The following token list corresponds to the key `continuation-symbol-on-indentation`. The name has been shorten to `csoi`.

```
209 \tl_new:N \l_@@_csoi_tl
210 \tl_set:Nn \l_@@_csoi_tl { $ \hookrightarrow ; $ }
```

The following token list corresponds to the key `end-of-broken-line`.

```
211 \tl_new:N \l_@@_end_of_broken_line_tl
212 \tl_set:Nn \l_@@_end_of_broken_line_tl { \hspace* { 0.5em } \textbackslash }
```

The following boolean corresponds to the key `break-lines-in-piton`.

```
213 \bool_new:N \l_@@_break_lines_in_piton_bool
```

The following dimension will be the width of the listing constructed by `{Piton}` or `\PitonInputFile`. If the user uses the key `width` of `\PitonOptions` with a numerical value, that value will be stored in `\l_@@_width_dim`.

```
214 \dim_new:N \l_@@_width_dim
215 % \end{macrocode}
216 %
217 % \bigskip
218 % |\g_@@_width_dim| will be the width of the environment, after construction.
219 % In particular, if |max-width| is used, |\g_@@_width_dim| has to be computed
220 % from the actual content of the environment.
221 % \begin{macrocode}
222 \dim_new:N \g_@@_width_dim
```

We will also use another dimension called `\l_@@_code_width_dim`. That will the width of the actual lines of code. That dimension may be lower than the whole `\l_@@_width_dim` because we have to take into account the value of `\l_@@_left_margin_dim` (for the numbers of lines when `line-numbers` is in force) and another small margin when a background color is used (with the key `background-color`).

```
223 \dim_new:N \l_@@_code_width_dim
```

The following flag will be raised when the key `max-width` (and when `width` is used with the key `min`, which is equivalent to `max-width=\linewidth`).

```
224 \bool_new:N \l_@@_minimize_width_bool
```

The following dimension corresponds to the key `left-margin` of `\PitonOptions`.

```
225 \dim_new:N \l_@@_left_margin_dim
```

The following boolean will be set when the key `left-margin=auto` is used.

```
226 \bool_new:N \l_@@_left_margin_auto_bool
```

The following dimension corresponds to the key `numbers-sep` of `\PitonOptions`.

```
227 \dim_new:N \l_@@_numbers_sep_dim
228 \dim_set:Nn \l_@@_numbers_sep_dim { 0.7 em }
```

Be careful. The following sequence `\g_@@_languages_seq` is not the list of the languages supported by `piton`. It's the list of the languages for which at least a user function has been defined. We need that sequence only for the command `\PitonClearUserFunctions` when it is used without its optional argument: it must clear all the list of languages for which at least a user function has been defined.

```
229 \seq_new:N \g_@@_languages_seq

230 \int_new:N \l_@@_tab_size_int
231 \int_set:Nn \l_@@_tab_size_int { 4 }

232 \cs_new_protected:Npn \@@_tab:
233 {
234   \bool_if:NTF \l_@@_show_spaces_bool
235   {
236     \hbox_set:Nn \l_tmpa_box
237     { \prg_replicate:nn \l_@@_tab_size_int { ~ } }
238     \dim_set:Nn \l_tmpa_dim { \box_wd:N \l_tmpa_box }
239     \(< \mathcolor { gray }
240       { \hbox_to_wd:nn \l_tmpa_dim { \rightarrowfill } } \)
241   }
242   { \hbox:n { \prg_replicate:nn \l_@@_tab_size_int { ~ } } }
243   \int_gadd:Nn \g_@@_indentation_int \l_@@_tab_size_int
244 }
```

The following integer corresponds to the key `gobble`.

```
245 \int_new:N \l_@@_gobble_int
```

The following token list will be used only for the spaces in the strings.

```
246 \tl_set_eq:NN \l_@@_space_in_string_tl \nobreakspace
```

When the key `break-lines-in-piton` is set, that parameter will be replaced by `\space` (in `\piton` with the standard syntax) and when the key `show-spaces-in-strings` is set, it will be replaced by `□` (U+2423).

At each line, the following counter will count the spaces at the beginning.

```
247 \int_new:N \g_@@_indentation_int
```

Be careful: when executed, the following command does *not* create a space (only an incrementation of the counter).

```
248 \cs_new_protected:Npn \@@_leading_space:
249 { \int_gincr:N \g_@@_indentation_int }
```

In the environment `{Piton}`, the command `\label` will be linked to the following command.

```
250 \cs_new_protected:Npn \@@_label:n #1
251 {
252   \bool_if:NTF \l_@@_line_numbers_bool
253   {
254     \@bsphack
255     \protected@write \@auxout { }
256     {
257       \string \newlabel { #1 }
258     }
259   }
```

Remember that the content of a line is typeset in a box *before* the composition of the potential number of line.

```
259   { \int_eval:n { \g_@@_visual_line_int + 1 } }
260   { \thepage }
261 }
262 }
```

```

263     \@esphack
264 }
265 { \@_error:n { label-with-lines-numbers } }
266 }

```

The following commands corresponds to the keys `marker/beginning` and `marker/end`. The values of that keys are functions that will be applied to the “*range*” specified by the final user in an individual `\PitonInputFile`. They will construct the markers used to find textually in the external file loaded by `piton` the part which must be included (and formatted).

These macros must *not* be protected.

```

267 \cs_new:Npn \@_marker_beginning:n #1 { }
268 \cs_new:Npn \@_marker_end:n #1 { }

```

The following token list will be evaluated at the beginning of `\@@_begin_line:...` `\@@_end_line:` and cleared at the end. It will be used by LPEG acting between the lines of the Python code in order to add instructions to be executed at the beginning of the line.

```

269 \tl_new:N \g_@@_begin_line_hook_tl

270 \tl_new:N \g_@@_after_line_hook_tl

```

For example, the LPEG Prompt will trigger the following command which will insert an instruction in the hook `\g_@@_begin_line_hook` to specify that a background must be inserted to the current line of code.

```

271 \cs_new_protected:Npn \@_prompt:
272 {
273   \tl_gset:Nn \g_@@_begin_line_hook_tl
274   {
275     \tl_if_empty:NF \l_@@_prompt_bg_color_tl
276     { \clist_set:Nn \l_@@_bg_color_clist { \l_@@_prompt_bg_color_tl } }
277   }
278 }

```

The spaces at the end of a line of code are deleted by `piton`. However, it’s not actually true: they are replace by `\@@_trailing_space:`.

```

279 \cs_new_protected:Npn \@_trailing_space: { }

```

When we have to rescan some pieces of code, we will use `\@@_piton:n`, which we will set `\@@_trailing_space:` equal to `\space`.

```

280 \bool_new:N \g_@@_color_is_none_bool
281 \bool_new:N \g_@@_next_color_is_none_bool

```

10.2.3 Detected commands

There are four keys for “detected commands and environments”: `detected-commands`, `raw-detected-commands`, `beamer-commands` and `beamer-environments`.

For each of those keys, we keep a `clist` of the names of such detected commands and environments. For the commands, the corresponding `clist` will contain the name of the commands *without* the backlash.

```

282 \clist_new:N \l_@@_detected_commands_clist
283 \clist_new:N \l_@@_raw_detected_commands_clist
284 \clist_new:N \l_@@_beamer_commands_clist
285 \clist_set:Nn \l_@@_beamer_commands_clist
286   { uncover , only , visible , invisible , alert , action }
287 \clist_new:N \l_@@_beamer_environments_clist
288 \clist_set:Nn \l_@@_beamer_environments_clist
289   { uncoverenv , onlyenv , visibleenv , invisibleenv , alertenv , actionenv }

```

Remark that, since we have used clists, these clists, as token lists are “purified”: there is no empty component and for each component, there is no space on both sides.

Of course, the value of those clists may be modified during the preamble of the document by using the corresponding key (‘detected-commands’, etc.).

However, after the `\begin{document}`, it’s no longer possible to modify those clists because their contents will be used in the construction of the main LPEG for each computer language.

However, in a `\AtBeginDocument`, we will convert those clists into “toks registers” of TeX.

```
290 \hook_gput_code:nnn { begindocument } { . }
291 {
292   \newtoks \PitonDetectedCommands
293   \newtoks \PitonRawDetectedCommands
294   \newtoks \PitonBeamerCommands
295   \newtoks \PitonBeamerEnvironments
```

L3 does *not* support those “toks registers” but it’s still possible to affect to the “toks registers” the content of the clists with a L3-like syntax.

```
296   \exp_args:NV \PitonDetectedCommands \l_@@_detected_commands_clist
297   \exp_args:NV \PitonRawDetectedCommands \l_@@_raw_detected_commands_clist
298   \exp_args:NV \PitonBeamerCommands \l_@@_beamer_commands_clist
299   \exp_args:NV \PitonBeamerEnvironments \l_@@_beamer_environments_clist
300 }
```

Then at the beginning of the document, when we will load the Lua file `piton.lua`, we will read those “toks registers” within Lua (with `tex.toks`) and convert them into Lua tables (and, then, use those tables to construct LPEG).

When the key `vertical-detected-commands` is used, we will have to redefine the corresponding commands in `@@_pre_composition`.

The instructions for these redefinitions will be put in the following token list.

```
301 \tl_new:N \g_@@_def_vertical_commands_tl

302 \cs_new_protected:Npn \@@_vertical_commands:n #1
303 {
304   \clist_put_right:Nn \l_@@_raw_detected_commands_clist { #1 }
305   \clist_map_inline:nn { #1 }
306   {
307     \cs_set_eq:cc { @@_old_ ##1 : } { ##1 }
308     \cs_new_protected:cn { @@_new_ ##1 : n }
309     {
310       \tl_gput_right:Nn \g_@@_after_line_hook_tl
311       { \use:c { @@_old_ ##1 : } { ####1 } }
312     }

```

10.2.4 Treatment of a line of code

```
317 \cs_new_protected:Npn \@@_replace_spaces:n #1
318 {
319   \tl_set:Nn \l_tmpa_tl { #1 }
320   \bool_if:NTF \l_@@_show_spaces_bool
321   {
322     \tl_set:Nn \l_@@_space_in_string_tl { } % U+2423
323     \tl_replace_all:NVn \l_tmpa_tl \c_catcode_other_space_tl { } % U+2423
324   }
325   {
```

If the key `break-lines-in-Piton` is in force, we replace all the characters U+0020 (that is to say the spaces) by `\@@_breakable_space:`. Remark that, except the spaces inserted in the LaTeX comments (and maybe in the math comments), all these spaces are of catcode “other” (=12) and are unbreakable.

```

326 \bool_if:NT \l_@@_break_lines_in_Piton_bool
327 {
328     \tl_if_eq:NnF \l_@@_space_in_string_tl { \_ }
329     { \tl_set_eq:NN \l_@@_space_in_string_tl \@@_breakable_space: }

```

In the following code, we have to replace all the spaces in the token list `\l_tmpa_tl`. That means that this replacement must be “recursive”: even the spaces which are within brace groups (`{...}`) must be replaced. For instance, the spaces in long strings of Python are within such groups since there are within a command `\PitonStyle{String.Long}{...}`. That’s why the use of `\tl_replace_all:Nnn` is not enough.

The first implementation was using `\regex_replace_all:nnN`

```
\regex_replace_all:nnN { \x20 } { \c { \@@_breakable_space: } } \l_tmpa_tl
```

but that programming was certainly slow.

Now, we use `\tl_replace_all:NvN` *but*, in the styles `String.Long.Internal` we replace the spaces with `\@@_breakable_space:` by another use of the same technic with `\tl_replace_all:NvN`. We do the same jog for the *doc strings* of Python and for the comments.

```

330 \tl_replace_all:NvN \l_tmpa_tl
331 \c_catcode_other_space_tl
332 \@@_breakable_space:
333 }
334 }
335 \l_tmpa_tl
336 }
337 \cs_generate_variant:Nn \@@_replace_spaces:n { o }

```

In the contents provided by Lua, each line of the Python code will be surrounded by `\@@_begin_line:` and `\@@_end_line:`.

`\@@_begin_line:` is a TeX command with a delimited argument (`\@@_end_line:` is the marker for the end of the argument).

However, we define also `\@@_end_line:` as no-op, because, when the last line of the listing is the end of an environment of Beamer (eg `\end{uncoverenv}`), we will have a token `\@@_end_line:` added at the end without any corresponding `\@@_begin_line:`).

```

338 \cs_set_protected:Npn \@@_end_line: { }

339 \cs_set_protected:Npn \@@_begin_line: #1 \@@_end_line:
340 {
341     \group_begin:
342     \g_@@_begin_line_hook_tl
343     \int_gzero:N \g_@@_indentation_int

```

We put the potential number of line, the potential left margin and the potential background.

```

344 \hbox_set:Nn \l_@@_line_box
345 {
346     \skip_horizontal:N \l_@@_left_margin_dim
347     \bool_if:NT \l_@@_line_numbers_bool
348     {

```

`\l_tmpa_int` will be equal to 1 when the current line is not empty.

```

349     \int_set:Nn \l_tmpa_int
350     {
351         \lua_now:e
352         {
353             tex.sprint
354             (
355                 luatexbase.catcodetables.expl ,

```

Since the argument of `tostring` will be a integer of Lua (*integer* is a sub-type of *number* introduced in Lua 5.3), the output will be of the form “3” (and not “3.0”) which is what we want for `\int_set:Nn`.

```

356         tostring

```

```

357         ( piton.empty_lines
358           [ \int_eval:n { \g_@@_line_int + 1 } ]
359         )
360       )
361     }
362   }
363   \bool_lazy_or:nnT
364   { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
365   { ! \l_@@_skip_empty_lines_bool }
366   { \int_gincr:N \g_@@_visual_line_int }
367   \bool_lazy_or:nnT
368   { \int_compare_p:nNn \l_tmpa_int = \c_one_int }
369   { ! \l_@@_skip_empty_lines_bool && \l_@@_label_empty_lines_bool }
370   \@@_print_number:
371 }

```

If there is a background, we must remind that there is a left margin of 0.5 em for the background...

```

372   \clist_if_empty:NF \l_@@_bg_color_clist
373   {
... but if only if the key left-margin is not used !
374     \dim_compare:nNnT \l_@@_left_margin_dim = \c_zero_dim
375     { \skip_horizontal:n { 0.5 em } }
376   }

```

```

377   \bool_if:NTF \l_@@_minimize_width_bool
378   {
379     \hbox_set:Nn \l_@@_line_box
380     {
381       \language = -1
382       \raggedright
383       \strut
384       \@@_replace_spaces:n { #1 }
385       \strut \hfil
386     }
387     \dim_compare:nNnTF
388     { \box_wd:N \l_@@_line_box } < \l_@@_code_width_dim
389     { \box_use:N \l_@@_line_box }
390     {
391       \vtop
392       {
393         \hsize = \l_@@_code_width_dim
394         \language = -1
395         \raggedright
396         \strut
397         \@@_replace_spaces:n { #1 }
398         \strut \hfil
399       }
400     }
401   }
402   {

```

Be careful: There is currying in the following code.

```

403   \bool_if:NTF \l_@@_minimize_width_bool
404   { \hbox }
405   { \vtop }
406   {
407     \bool_if:NF \l_@@_minimize_width_bool
408     { \hsize = \l_@@_code_width_dim }
409     \language = -1
410     \raggedright
411     \strut
412     \@@_replace_spaces:n { #1 }
413     \strut \hfil
414   }

```

```

415     }
416 }

```

Now, the line of code is composed in the box `\l_@@_line_box`.

```

417 \box_set_dp:Nn \l_@@_line_box { \box_dp:N \l_@@_line_box + 1.25 pt }
418 \box_set_ht:Nn \l_@@_line_box { \box_ht:N \l_@@_line_box + 1.25 pt }
419 \dim_gset_eq:NN \g_@@_width_dim \l_@@_width_dim

```

Maybe we will have to put a colored background for that line of code.

```

420 \bool_lazy_or:nnTF
421 { \clist_if_empty_p:N \l_@@_bg_color_clist }
422 { \l_@@_minimize_width_bool }
423 { \box_use_drop:N \l_@@_line_box }
424 { \@@_add_background_to_line_and_use: }
425 \group_end:
426 \g_@@_after_line_hook_tl
427 \tl_gclear:N \g_@@_after_line_hook_tl
428 \tl_gclear:N \g_@@_begin_line_hook_tl
429 }

```

Of course, the following command will be used when the key `background-color` is used.

However, one must remark that it will be used both in `\@@_add_backgrounds_to_output_box:` (when `max-width` or `width=min` is used) and in `\@@_begin_line:... \@@_end_line:` (elsewhere).

The content of the line has been previously set in `\l_@@_line_box`.

```

430 \cs_new_protected:Npn \@@_add_background_to_line_and_use:
431 {
432   \vtop
433   {
434     \offinterlineskip
435     \hbox
436     {

```

`\@@_color:N` sets the current color but also sets the booleans `\g_@@_color_is_none_bool` and `\g_@@_next_color_is_none_bool`.

```

437 \@@_color:N \l_@@_bg_color_clist

```

The colored panels are overlapping. However, if the special color `none` is used we must not put such overlapping.

```

438 \dim_set:Nn \l_tmpa_dim { \box_dp:N \l_@@_line_box }
439 \bool_if:NT \g_@@_next_color_is_none_bool
440 { \dim_sub:Nn \l_tmpa_dim { 2.5 pt } }

```

When `\g_@@_color_is_none_bool` is in force, we will compose a `\vrule` of width 0 pt. We need that `\vrule` because it will be a strut.

```

441 \bool_if:NTF \g_@@_color_is_none_bool
442 { \dim_zero:N \l_tmpb_dim }
443 { \dim_set_eq:NN \l_tmpb_dim \g_@@_width_dim }

```

Now, the colored panel.

```

444 \vrule height \box_ht:N \l_@@_line_box
445         depth \l_tmpa_dim
446         width \l_tmpb_dim
447 }
448 \bool_if:NT \g_@@_next_color_is_none_bool
449 { \skip_vertical:n { 2.5 pt } }
450 \skip_vertical:n { - \box_ht_plus_dp:N \l_@@_line_box }
451 \box_use_drop:N \l_@@_line_box
452 }
453 }

```

The command `\@@_color:N` will take in as argument a reference to a comma-separated list of colors. A color will be picked by using the value of `\g_@@_line_int` (modulo the number of colors in the list).

```

454 \cs_set_protected:Npn \@@_color:N #1

```

```

455 {
456   \int_set:Nn \l_tmpa_int { \clist_count:N #1 }
457   \int_set:Nn \l_tmpb_int { \int_mod:nn \g_@@_line_int \l_tmpa_int + 1 }
458   \tl_set:Ne \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
459   \tl_if_eq:NnTF \l_tmpa_tl { none }
460     { \bool_gset_true:N \g_@@_color_is_none_bool }
461     {
462       \bool_gset_false:N \g_@@_color_is_none_bool
463       \@@_color_i:o \l_tmpa_tl
464     }
465 % \end{macrocode}
466 % We are looking for the next color because we have to know whether that
467 % color is the special color |none|.
468 % \begin{macrocode}
469   \int_compare:NnTF { \g_@@_line_int + 1 } = \l_@@_nb_lines_int
470     { \bool_gset_false:N \g_@@_next_color_is_none_bool }
471     {
472       \int_set:Nn \l_tmpb_int
473         { \int_mod:nn { \g_@@_line_int + 1 } \l_tmpa_int + 1 }
474       \tl_set:Ne \l_tmpa_tl { \clist_item:Nn #1 \l_tmpb_int }
475       \tl_if_eq:NnTF \l_tmpa_tl { none }
476         { \bool_gset_true:N \g_@@_next_color_is_none_bool }
477         { \bool_gset_false:N \g_@@_next_color_is_none_bool }
478     }
479 }

```

The following command `\@@_color:n` will accept both the instruction `\@@_color:n { red!15 }` and the instruction `\@@_color:n { [rgb]{0.9,0.9,0} }`.

```

480 \cs_set_protected:Npn \@@_color_i:n #1
481 {
482   \tl_if_head_eq_meaning:nNTF { #1 } [
483     {
484       \tl_set:Nn \l_tmpa_tl { #1 }
485       \tl_set_rescan:Nno \l_tmpa_tl { } \l_tmpa_tl
486       \exp_last_unbraced:No \color \l_tmpa_tl
487     }
488     { \color { #1 } }
489   }
490 \cs_generate_variant:Nn \@@_color_i:n { o }

```

The command `\@@_newline:` will be inserted by Lua between two lines of the informatic listing.

- In fact, it will be inserted between two commands `\@@_begin_line:...\@@_end_of_line:.`
- When the key `break-lines-in-Piton` is in force, a line of the informatic code (the *input*) may result in several lines in the PDF (the *output*).
- Remind that `\@@_newline:` has a rather complex behaviour because it will finish and start paragraphs.

```

491 \cs_new_protected:Npn \@@_newline:
492 {
493   \bool_if:NT \g_@@_footnote_bool \endsavenotes

```

We recall that `\g_@@_line_int` is *not* used for the number of line printed in the PDF (when `line-numbers` is in force)...

```

494   \int_gincr:N \g_@@_line_int

```

... it will be used to allow or disallow page breaks.

Each line in the listing is composed in a box of TeX (which may contain several lines when the key `break-lines-in-Piton` is in force) put in a paragraph.

```

495   \par

```

We now add a `\kern` because each line of code is overlapping vertically by a quantity of 2.5 pt in order to have a good background (when `background-color` is in force). We need to use a `\kern` (in fact `\par\kern...`) and not a `\vskip` because page breaks should *not* be allowed on that kern.

```

496   \kern -2.5 pt

```

Now, we control page breaks after the paragraph. We use the Lua table `piton.lines_status` which has been written by `piton.ComputeLinesStatus` for this aim. Each line has a “status” (equal to 0, 1 or 2) and that status directly says whether a break is allowed.

```

497 \int_case:nn
498 {
499   \lua_now:e
500   {
501     tex.sprint
502     (
503       luatexbase.catcodetables.expl ,
504       tostring ( piton.lines_status [ \int_use:N \g_@@_line_int ] )
505     )
506   }
507 }
508 { 1 { \penalty 100 } 2 \nobreak }
509 \bool_if:NT \g_@@_footnote_bool \savenotes
510 }

```

After the command `\@@_newline:`, we will usually have a command `\@@_begin_line:`.

The following command `\@@_breakable_space:` is for breakable spaces in the environments `{Piton}` and the listings of `\PitonInputFile` and *not* for the commands `\piton`.

```

511 \cs_set_protected:Npn \@@_breakable_space:
512 {
513   \discretionary
514   { \hbox:n { \color { gray } \l_@@_end_of_broken_line_tl } }
515   {
516     \hbox_overlap_left:n
517     {
518       {
519         \normalfont \footnotesize \color { gray }
520         \l_@@_continuation_symbol_tl
521       }
522       \skip_horizontal:n { 0.3 em }
523       \clist_if_empty:NF \l_@@_bg_color_clist
524       { \skip_horizontal:n { 0.5 em } }
525     }
526     \bool_if:NT \l_@@_indent_broken_lines_bool
527     {
528       \hbox:n
529       {
530         \prg_replicate:nn { \g_@@_indentation_int } { ~ }
531         { \color { gray } \l_@@_csoi_tl }
532       }
533     }
534   }
535   { \hbox { ~ } }
536 }

```

853   \keys_set:nn { PitonOptions } { #1 }
854   \bool_set_false:N \l_@@_in_PitonOptions_bool
855 }

```

When using `\NewPitonEnvironment` a user may use `\PitonOptions` inside. However, the set of keys available should be different that in standard `\PitonOptions`. That's why we define a version of `\PitonOptions` with no restriction on the set of available keys and we will link that version to `\PitonOptions` in such environment.

```

856 \NewDocumentCommand \@@_fake_PitonOptions { }
857 { \keys_set:nn { PitonOptions } }

```

10.2.6 The numbers of the lines

The following counter will be used to count the lines in the code when the user requires the numbers of the lines to be printed (with `line-numbers`) whereas the counter `\g_@@_line_int` previously defined is *not* used for that functionality.

```

858 \int_new:N \g_@@_visual_line_int
859 \cs_new_protected:Npn \@@_incr_visual_line:
860 {
861   \bool_if:NF \l_@@_skip_empty_lines_bool
862   { \int_gincr:N \g_@@_visual_line_int }
863 }

864 \cs_new_protected:Npn \@@_print_number:
865 {
866   \hbox_overlap_left:n
867   {
868     {
869       \l_@@_line_numbers_format_tl

```

We put braces. Thus, the user may use the key `line-numbers/format` with a value such as `\fbox`.

```

870     { \int_to_arabic:n \g_@@_visual_line_int }
871   }
872   \skip_horizontal:N \l_@@_numbers_sep_dim
873 }
874 }

```

10.2.7 The main commands and environments for the final user

```

875 \NewDocumentCommand { \NewPitonLanguage } { 0 { } m ! o }
876 {
877   \tl_if_novalue:nTF { #3 }

```

The last argument is provided by curryfication.

```

878   { \@@_NewPitonLanguage:nnn { #1 } { #2 } }

```

The two last arguments are provided by curryfication.

```

879   { \@@_NewPitonLanguage:nnnn { #1 } { #2 } { #3 } }
880 }

```

The following property list will contain the definitions of the informatic languages as provided by the final user. However, if a language is defined over another base language, the corresponding list will contain the *whole* definition of the language.

```

881 \prop_new:N \g_@@_languages_prop

```

```

882 \keys_define:nn { NewPitonLanguage }
883 {
884     morekeywords .code:n = ,
885     otherkeywords .code:n = ,
886     sensitive .code:n = ,
887     keywordsprefix .code:n = ,
888     moretexcs .code:n = ,
889     morestring .code:n = ,
890     morecomment .code:n = ,
891     moredelim .code:n = ,

893     tag .code:n = ,
894     alsodigit .code:n = ,
895     alsoletter .code:n = ,
896     alsoother .code:n = ,
897     unknown .code:n = \@@_error:n { Unknown~key~NewPitonLanguage }
898 }

```

The function `\@@_NewPitonLanguage:nnn` will be used when the language is *not* defined above a base language (and a base dialect).

```

899 \cs_new_protected:Npn \@@_NewPitonLanguage:nnn #1 #2 #3
900 {

```

We store in `\l_tmpa_tl` the name of the language with the potential dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have written `\NewPitonLanguage[]{Java}{...}`.

```

901     \tl_set:Ne \l_tmpa_tl
902     {
903         \tl_if_blank:nF { #1 } { [ \str_lowercase:n { #1 } ] }
904         \str_lowercase:n { #2 }
905     }

```

The following set of keys is only used to raise an error when a key is unknown!

```

906     \keys_set:nn { NewPitonLanguage } { #3 }

```

We store in LaTeX the definition of the language because some languages may be defined with that language as base language.

```

907     \prop_gput:Non \g_@@_languages_prop \l_tmpa_tl { #3 }

```

The Lua part of the package `piton` will be loaded in a `\AtBeginDocument`. Hence, we will put also in a `\AtBeginDocument` the use of the Lua function `piton.new_language` (which does the main job).

```

908     \@@_NewPitonLanguage:on \l_tmpa_tl { #3 }
909 }
910 \cs_new_protected:Npn \@@_NewPitonLanguage:nn #1 #2
911 {
912     \hook_gput_code:nnn { begindocument } { . }
913     { \lua_now:e { piton.new_language("#1","\lua_escape:n{#2}") } }
914 }
915 \cs_generate_variant:Nn \@@_NewPitonLanguage:nn { o }

```

Now the case when the language is defined upon a base language.

```

916 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnnn #1 #2 #3 #4 #5
917 {

```

We store in `\l_tmpa_tl` the name of the base language with the dialect, that is to say, for example : `[AspectJ]{Java}`. We use `\tl_if_blank:nF` because the final user may have used `\NewPitonLanguage[Handel]{C}[]{C}{...}`

```

918     \tl_set:Ne \l_tmpa_tl
919     {
920         \tl_if_blank:nF { #3 } { [ \str_lowercase:n { #3 } ] }
921         \str_lowercase:n { #4 }
922     }

```

We retrieve in `\l_tmpb_tl` the definition (as provided by the final user) of that base language. Caution: `\g_@@_languages_prop` does not contain all the languages provided by `piton` but only those defined by using `\NewPitonLanguage`.

```

923 \prop_get:NnTF \g_@@_languages_prop \l_tmpa_tl \l_tmpb_tl

```

We can now define the new language by using the previous function.

```

924 { \@@_NewPitonLanguage:nnno { #1 } { #2 } { #5 } \l_tmpb_tl }
925 { \@@_error:n { Language~not~defined } }
926 }

```

```

927 \cs_new_protected:Npn \@@_NewPitonLanguage:nnnn #1 #2 #3 #4

```

In the following line, we write #4,#3 and not #3,#4 because we want that the keys which correspond to base language appear before the keys which are added in the language we define.

```

928 { \@@_NewPitonLanguage:nnn { #1 } { #2 } { #4 , #3 } }
929 \cs_generate_variant:Nn \@@_NewPitonLanguage:nnnn { n n n o }

```

```

930 \NewDocumentCommand { \piton } { }
931 { \peek_meaning:NTF \bgroup { \@@_piton_standard } { \@@_piton_verbatim } }
932 \NewDocumentCommand { \@@_piton_standard } { m }
933 {
934   \group_begin:
935   \tl_if_eq:NnF \l_@@_space_in_string_tl { } {
936     {

```

Remind that, when `break-strings-anywhere` is in force, multiple commands `\-` will be inserted between the characters of the string to allow the breaks. The `\exp_not:N` before `\space` is mandatory.

```

937   \bool_lazy_or:nnT
938   \l_@@_break_lines_in_piton_bool
939   \l_@@_break_strings_anywhere_bool
940   { \tl_set:Nn \l_@@_space_in_string_tl { \exp_not:N \space } }
941 }

```

The following tuning of LuaTeX in order to avoid all breaks of lines on the hyphens.

```

942 \automatichyphenmode = 1

```

Remark that the argument of `\piton` (with the normal syntax) is expanded in the TeX sens, (see the `\tl_set:Ne` below) and that's why we can provide the following escapes to the final user:

```

943 \cs_set_eq:NN \ \ \c_backslash_str
944 \cs_set_eq:NN \% \c_percent_str
945 \cs_set_eq:NN \{ \c_left_brace_str
946 \cs_set_eq:NN \} \c_right_brace_str
947 \cs_set_eq:NN \$ \c_dollar_str

```

The standard command `_` is *not* expandable and we need here expandable commands. With the following code, we define an expandable command.

```

948 \cs_set_eq:cN { ~ } \space
949 \cs_set_eq:NN \@@_begin_line: \prg_do_nothing:
950 \tl_set:Ne \l_tmpa_tl
951 {
952   \lua_now:e
953   { piton.ParseBis('\l_piton_language_str',token.scan_string()) }
954   { #1 }
955 }
956 \bool_if:NTF \l_@@_show_spaces_bool

1047             }
1048         }
1049         \dim_set:Nn \l_@@_left_margin_dim
1050         { \box_wd:N \l_tmpa_box + \l_@@_numbers_sep_dim + 0.1 em }
1051     }
1052 }
1053 \cs_generate_variant:Nn \@@_compute_left_margin:nn { n o }

```

The following command computes `\g_@@_width_dim` and it will be used when `max-width` or `width=min` is used.

```

1054 \cs_new_protected:Npn \@@_compute_width:
1055 {
1056     \dim_gset:Nn \g_@@_width_dim { \box_wd:N \g_@@_output_box }
1057     \clist_if_empty:NTF \l_@@_bg_color_clist
1058     { \dim_gadd:Nn \g_@@_width_dim \l_@@_left_margin_dim }
1059     {
1060         \dim_gadd:Nn \g_@@_width_dim { 0.5 em }
1061         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1062         { \dim_gadd:Nn \g_@@_width_dim { 0.5 em } }
1063         { \dim_gadd:Nn \g_@@_width_dim \l_@@_left_margin_dim }
1064     }
1065 }

```

Whereas `\l_@@_width_dim` is the width of the environment as specified by the key `width` (except when `max-width` or `width=min` is used), `\l_@@_code_width_dim` is the width of the lines of code without the potential margins for the numbers of lines and the background.

The following command will be used only in `\@@_create_output_box`: when `width=min` is *not* in force before the composition of `\g_@@_output_box`.

```

1066 \cs_new_protected:Npn \@@_compute_code_width:
1067 {
1068     \dim_set_eq:NN \l_@@_code_width_dim \l_@@_width_dim
1069     \clist_if_empty:NTF \l_@@_bg_color_clist

```

If there is no background, we only subtract the left margin.

```

1070     { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }

```

If there is a background, we subtract 0.5 em for the margin on the right.

```

1071     {
1072         \dim_sub:Nn \l_@@_code_width_dim { 0.5 em }

```

And we subtract also for the left margin. If the key `left-margin` has been used (with a numerical value or with the special value `min`), `\l_@@_left_margin_dim` has a non-zero value³⁴ and we use that value. Elsewhere, we use a value of 0.5 em.

```

1073         \dim_compare:nNnTF \l_@@_left_margin_dim = \c_zero_dim
1074         { \dim_sub:Nn \l_@@_code_width_dim { 0.5 em } }
1075         { \dim_sub:Nn \l_@@_code_width_dim \l_@@_left_margin_dim }
1076     }
1077 }

```

For the following commands, the arguments are provided by currying.

```

1078 \NewDocumentCommand { \NewPitonEnvironment } { }
1079 { \@@_DefinePitonEnvironment:nnnnn { New } }
1080 \NewDocumentCommand { \DeclarePitonEnvironment } { }
1081 { \@@_DefinePitonEnvironment:nnnnn { Declare } }
1082 \NewDocumentCommand { \RenewPitonEnvironment } { }
1083 { \@@_DefinePitonEnvironment:nnnnn { Renew } }
1084 \NewDocumentCommand { \ProvidePitonEnvironment } { }
1085 { \@@_DefinePitonEnvironment:nnnnn { Provide } }

```

The first argument of the following macro is one of the four strings: `New`, `Renew`, `Provide` and `Declare`.

```

1086 \cs_new_protected:Npn \@@_DefinePitonEnvironment:nnnnn #1 #2 #3 #4 #5
1087 {

```

We construct a TeX macro which will catch as argument all the tokens until `\end{name_env}` with, in that `\end{name_env}`, the catcodes of `\`, `{` and `}` equal to 12 (“other”). The latter explains why the definition of that function is a bit complicated.

```

1088     \use:x
1089     {
1090         \cs_set_protected:Npn
1091             \use:c { _@@_collect_ #2 :w }
1092             ###1
1093             \c_backslash_str end \c_left_brace_str #2 \c_right_brace_str
1094     }
1095     {
1096         \group_end:

```

Maybe, we should deactivate all the “shorthands” of `babel` (when `babel` is loaded) with the following instruction:

```
\IfPackageLoadedT { babel } { \languageshorthands { none } }
```

But we should be sure that there is no consequence in the LaTeX comments...

```

1097         \tl_set:Nn \l_@@_body_tl { ##1 }
1098         \@@_composition:
1099 % \end{macrocode}
1100 %
1101 % The following |\end{#2}| is only for the stack of environments of LaTeX.
1102 % \begin{macrocode}
1103         \end { #2 }

```

³⁴If the key `left-margin` has been used with the special value `min`, the actual value of `\l_@@_left_margin_dim` has yet been computed when we use the current command.

```
1104 }
```

We can now define the new environment.

We are still in the definition of the command `\NewPitonEnvironment...`

```
1105 \use:c { #1 DocumentEnvironment } { #2 } { #3 }
1106 {
1107   \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
1108   #4
1109   \@@_pre_composition:
1110   \int_compare:nNnT { \l_@@_number_lines_start_int } > { \c_zero_int }
1111   { \int_gset:Nn \g_@@_visual_line_int { \l_@@_number_lines_start_int - 1 } }
1112   \group_begin:
1113   \tl_map_function:nN
1114   { \ \ \ \ { \} \ $ \& \# \^ \_ \% \~ \^^I }
1115   \char_set_catcode_other:N
1116   \use:c { _@@_collect_ #2 :w }
1117 }
1118 {
1119   #5
1120   \ignorespacesafterend
1121 }
```

The following code is for technical reasons. We want to change the catcode of `^^M` before catching the arguments of the new environment we are defining. Indeed, if not, we will have problems if there is a final optional argument in our environment (if that final argument is not used by the user in an instance of the environment, a spurious space is inserted, probably because the `^^M` is converted to space).

```
1122 \AddToHook { env / #2 / begin } { \char_set_catcode_other:N ^^M }
1123 }
```

This is the end of the definition of the command `\NewPitonEnvironment`.

```
1124 \IfFormatAtLeastTF { 2025-06-01 }
1125 {
```

We will retrieve the body of the environment in `\l_@@_body_tl`.

```
1126 \cs_new_protected:Npn \@@_store_body:n #1
1127 {
```

Now, we have to replace all the occurrences of `\obeyedline` by a character of end of line (`\r` in the strings of Lua).

```
1128 \tl_set:Nc \obeyedline { \char_generate:nm { 13 } { 11 } }
1129 \tl_set:Nc \l_@@_body_tl { #1 }
1130 \tl_set_eq:NN \ProcessedArgument \l_@@_body_tl
1131 }
```

The first argument of the following macro is one of the four strings: `New`, `Renew`, `Provide` and `Declare`.

```
1132 \cs_set_protected:Npn \@@_DefinePitonEnvironment:nnnnn #1 #2 #3 #4 #5
1133 {
1134   \use:c { #1 DocumentEnvironment } { #2 } { #3 > { \@@_store_body:n } c }
1135   {
1136     \cs_set_eq:NN \PitonOptions \@@_fake_PitonOptions
1137     #4
1138     \@@_pre_composition:
1139     \int_compare:nNnT { \l_@@_number_lines_start_int } > { \c_zero_int }
1140     {
1141       \int_gset:Nn \g_@@_visual_line_int
1142       { \l_@@_number_lines_start_int - 1 }
1143     }
1144 }
```

Now, the main job.

```
1144 \@@_composition:
1145 #5
1146 }
1147 { \ignorespacesafterend }
1148 }
```

```

1149 }
1150 { }
1151 \cs_new_protected:Npn \l_@@_composition:
1152 {
1153   \str_if_empty:NT \l_@@_box_str
1154   { \mode_if_vertical:TF { \noindent } { \newline } }

```

The following line is only to compute `\l_@@_lines_int` which will be used only when both `left-margin=auto` and `skip-empty-lines = false` are in force. We should change that.

```

1155   \lua_now:e { piton.CountLines ( '\lua_escape:n{\l_@@_body_tl}' ) }

```

The first argument of the following function is the name of the Lua function that will be applied to the second argument in order to count the number of lines.

```

1156   \@@_compute_left_margin:no { CountNonEmptyLines } { \l_@@_body_tl }
1157   \lua_now:e
1158   {
1159     piton.join = "\l_@@_join_str"
1160     piton.write = "\l_@@_write_str"
1161     piton.path_write = "\l_@@_path_write_str"
1162   }
1163   \noindent
1164   \bool_if:NTF \l_@@_print_bool
1165   {

```

When `split-on-empty-lines` is in force, each chunk will be formatted by an environment `{Piton}` (or the environment specified by `env-used-by-split`). Within each of these environments, we will come back here (but, of course, `split-on-empty-line` will have been set to `false`).

```

1166   \bool_if:NTF \l_@@_split_on_empty_lines_bool
1167   { \@@_retrieve_gobble_split_parse:o \l_@@_body_tl }
1168   {
1169     \@@_create_output_box:

```

Now, the listing has been composed in `\g_@@_output_box` and `\g_@@_width_dim` contains the width of the listing (with the potential margin for the numbers of lines).

1225         \clist_if_empty:NF \l_@@_bg_color_clist
1226         { \@@_add_backgrounds_to_output_box: }
1227     }
1228 }

```

Usually, we add the backgrounds under each line when the line is composed in `\@@_begin_line:`. However, it's not possible when the width of the environment must be minimized. In that case, we add the backgrounds after the composition of the box `\g_@@_output_box` by a loop over the lines in that box.

However, in fact, we could drop the first technic and always use that one for the backgrounds (but it would be a bit slower...).

```

1229 \cs_new_protected:Npn \@@_add_backgrounds_to_output_box:
1230 {
1231     \int_gzero:N \g_@@_line_int

```

`\l_tmpa_box` is only used to *unpack* the vertical box `\g_@@_output_box`.

```

1232     \vbox_set:Nn \l_tmpa_box
1233     {
1234         \vbox_unpack_drop:N \g_@@_output_box

```

We will raise `\g_tmpa_bool` to exit the loop `\bool_do_until:nn` below.

```

1235     \bool_gset_false:N \g_tmpa_bool
1236     \unskip \unskip

```

We begin the loop.

```

1237     \bool_do_until:nn \g_tmpa_bool
1238     {
1239         \unskip \unskip \unskip
1240         \int_set_eq:NN \l_tmpa_int \lastpenalty
1241         \unpenalty \unkern

```

In standard TeX (not LuaTeX), the only way to loop over the sub-boxes of a given box is to use the TeX primitive `\lastbox` (via `\box_set_to_last:N` of L3). Of course, it would be interesting to replace that programming by a programming in Lua of LuaTeX...

```

1242     \box_set_to_last:N \l_@@_line_box
1243     \box_if_empty:NTF \l_@@_line_box
1244     { \bool_gset_true:N \g_tmpa_bool }
1245     {

```

```

1246         \vbox_gset:Nn \g_@@_output_box

We have, when `break-lines-in-Piton` is in force, to replace the spaces by `\@@_breakable_space:` because, when we have done a similar job in `\@@_replace_spaces:n` used in `\@@_begin_line:`, that job was not able to do the replacement in the brace group `{...}` of `\PitonStyle{String.Long}{...}` because we used a `\tl_replace_all:NVn`. At that time, it would have been possible to use a `\tl_regex_replace_all:Nnn` but it is notoriously slow.

```

We need the command `\@@_identifier:n` because of the command `\SetPitonIdentifier`. The command `\@@_identifier:n` will potentially call the style `Identifier` (which is a user-style, not an internal style).

```

1663 Identifier.Internal = \@@_identifier:n ,
1664 Identifier          = ,
1665 Directive           = \color [ HTML ] { AA6600} ,
1666 Tag                 = \colorbox { gray!10 } ,
1667 UserFunction         = \PitonStyle { Identifier } ,
1668 Prompt              = ,
1669 Discard              = \use_none:n
1670 }

```

If the key `math-comments` has been used in the preamble of the LaTeX document, we change the style `Comment.Math` which should be considered only at an “internal style”. However, maybe we will document in a future version the possibility to write change the style *locally* in a document)].

```

1671 \hook_gput_code:nnn { begindocument } { . }
1672 {
1673   \bool_if:NT \g_@@_math_comments_bool
1674     { \SetPitonStyle { Comment.Math = \@@_math_scantokens:n } }
1675 }

```

10.2.10 Highlighting some identifiers

```

1676 \NewDocumentCommand { \SetPitonIdentifier } { o m m }
1677 {
1678   \clist_set:Nn \l_tmpa_clist { #2 }
1679   \tl_if_novalue:nTF { #1 }
1680   {
1681     \clist_map_inline:Nn \l_tmpa_clist
1682       { \cs_set:cpn { PitonIdentifier _ ##1 } { #3 } }
1683   }
1684   {
1685     \str_set:Ne \l_tmpa_str { \str_lowercase:n { #1 } }
1686     \str_if_eq:onT \l_tmpa_str { current-language }
1687       { \str_set_eq:NN \l_tmpa_str \l_piton_language_str }
1688     \clist_map_inline:Nn \l_tmpa_clist
1689       { \cs_set:cpn { PitonIdentifier _ \l_tmpa_str _ ##1 } { #3 } }
1690   }
1691 }
1692 \cs_new_protected:Npn \@@_identifier:n #1
1693 {
1694   \cs_if_exist_use:cF { PitonIdentifier _ \l_piton_language_str _ #1 }
1695   {
1696     \cs_if_exist_use:cF { PitonIdentifier _ #1 }
1697     { \PitonStyle { Identifier } }
1698   }
1699   { #1 }
1700 }

```

In particular, we have an highlighting of the identifiers which are the names of Python functions previously defined by the user. Indeed, when a Python function is defined, the style `Name.Function.Internal` is applied to that name. We define now that style (you define it directly and you short-cut the function `\SetPitonStyle`).

```

1701 \cs_new_protected:cpn { pitonStyle _ Name.Function.Internal } #1
1702 {

```

First, the element is composed in the TeX flow with the style `Name.Function` which is provided to the final user.

```

1703   { \PitonStyle { Name.Function } { #1 } }

```

Now, we specify that the name of the new Python function is a known identifier that will be formatted with the Piton style `UserFunction`. Of course, here the affectation is global because we have to exit many groups and even the environments `{Piton}`).

```

1704 \cs_gset_protected:cpn { PitonIdentifier _ \l_piton_language_str _ #1 }
1705 { \PitonStyle { UserFunction } }

```

Now, we put the name of that new user function in the dedicated sequence (specific of the current language). **That sequence will be used only by \PitonClearUserFunctions.**

```

1706 \seq_if_exist:cF { g_@@_functions _ \l_piton_language_str _ seq }
1707 { \seq_new:c { g_@@_functions _ \l_piton_language_str _ seq } }
1708 \seq_gput_right:cn { g_@@_functions _ \l_piton_language_str _ seq } { #1 }

```

We update \g_@@_languages_seq which is used only by the command \PitonClearUserFunctions when it's used without its optional argument.

```

1709 \seq_if_in:NoF \g_@@_languages_seq { \l_piton_language_str }
1710 { \seq_gput_left:No \g_@@_languages_seq { \l_piton_language_str } }
1711 }

```

```

1712 \NewDocumentCommand \PitonClearUserFunctions { ! o }
1713 {
1714   \tl_if_novalue:nTF { #1 }

```

If the command is used without its optional argument, we will deleted the user language for all the computer languages.

```

1715   { \@@_clear_all_functions: }
1716   { \@@_clear_list_functions:n { #1 } }
1717 }

```

```

1718 \cs_new_protected:Npn \@@_clear_list_functions:n #1

```

10.3 The Lua part of the implementation

The Lua code will be loaded via a `{luacode*}` environment. The environment is by itself a Lua block and the local declarations will be local to that block. All the global functions (used by the L3 parts of the implementation) will be put in a Lua table called `piton`.

```

1980 <*LUA>
1981 piton.comment_latex = piton.comment_latex or ">"
1982 piton.comment_latex = "#" .. piton.comment_latex

```

The table `piton.write_files` will contain the contents of all the files that we will write on the disk in the `\AtEndDocument` (if the user has used the key `write-file`). The table `piton.join_files` is similar for the key `join`.

```

1983 piton.write_files = { }
1984 piton.join_files = { }

1985 local sprintL3
1986 function sprintL3 ( s )
1987     tex.sprint ( luatexbase.catcodetables.expl , s )
1988 end

```

10.3.1 Special functions dealing with LPEG

We will use the Lua library `lpeg` which is built in LuaTeX. That's why we define first aliases for several functions of that library.

```

1989 local P, S, V, C, Ct, Cc = lpeg.P, lpeg.S, lpeg.V, lpeg.C, lpeg.Ct, lpeg.Cc
1990 local Cg, Cmt, Cb = lpeg.Cg, lpeg.Cmt, lpeg.Cb
1991 local B, R = lpeg.B, lpeg.R

```

The following line is mandatory.

```

1992 lpeg.locale(lpeg)

```

10.3.2 The functions Q, K, WithStyle, etc.

The function `Q` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with the catcode “other” for all the characters: it's suitable for elements of the informatic listings that `piton` will typeset verbatim (thanks to the catcode “other”).

```

1993 local Q
1994 function Q ( pattern )
1995     return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
1996 end

```

The function `L` takes in as argument a pattern and returns a LPEG *which does a capture* of the pattern. That capture will be sent to LaTeX with standard LaTeX catcodes for all the characters: the elements captured will be formatted as normal LaTeX codes. It's suitable for the “LaTeX comments” in the environments `{Piton}` and the elements between `begin-escape` and `end-escape`. That function won't be much used.

```

1997 local L
1998 function L ( pattern ) return
1999     Ct ( C ( pattern ) )
2000 end

```

The function `Lc` (the `c` is for *constant*) takes in as argument a string and returns a LPEG *with does a constant capture* which returns that string. The elements captured will be formatted as L3 code. It will be used to send to LaTeX all the formatting LaTeX instructions we have to insert in order to do the syntactic highlighting (that's the main job of `piton`). That function, unlike the previous one, will be widely used.

```

2001 local Lc
2002 function Lc ( string ) return
2003   Cc ( { luatexbase.catcodetables.expl , string } )
2004 end

```

The function `K` creates a LPEG which will return as capture the whole LaTeX code corresponding to a Python chunk (that is to say with the LaTeX formatting instructions corresponding to the syntactic nature of that Python chunk). The first argument is a Lua string corresponding to the name of a `piton` style and the second element is a pattern (that is to say a LPEG without capture)

```

2005 e
2006 local K
2007 function K ( style , pattern ) return
2008   Lc ( [[ {\PitonStyle{ ]] .. style .. "}{" )
2009   * Q ( pattern )
2010   * Lc "}}"
2011 end

```

The formatting commands in a given `piton` style (eg. the style `Keyword`) may be semi-global declarations (such as `\bfseries` or `\slshape`) or LaTeX macros with an argument (such as `\fbox` or `\colorbox{yellow}`). In order to deal with both syntaxes, we have used two pairs of braces: `{\PitonStyle{Keyword}{text to format}}`.

The following function `WithStyle` is similar to the function `K` but should be used for multi-lines elements.

```

2012 local WithStyle
2013 function WithStyle ( style , pattern ) return
2014   Ct ( Cc "Open" * Cc ( [[{\PitonStyle{ ]] .. style .. "}{" ) * Cc "}" )
2015   * pattern
2016   * Ct ( Cc "Close" )
2017 end

```

The following LPEG catches the Python chunks which are in LaTeX escapes (and that chunks will be considered as normal LaTeX constructions).

```

2018 Escape = P ( false )
2019 EscapeClean = P ( false )
2020 if piton.begin_escape then
2021   Escape =
2022     P ( piton.begin_escape )
2023     * L ( ( 1 - P ( piton.end_escape ) ) ^ 1 )
2024     * P ( piton.end_escape )

```

The LPEG `EscapeClean` will be used in the LPEG `Clean` (and that LPEG is used to “clean” the code by removing the formatting elements).

```

2025   EscapeClean =
2026     P ( piton.begin_escape )
2027     * ( 1 - P ( piton.end_escape ) ) ^ 1
2028     * P ( piton.end_escape )
2029 end
2030 EscapeMath = P ( false )
2031 if piton.begin_escape_math then
2032   EscapeMath =
2033     P ( piton.begin_escape_math )
2034     * Lc "$"
2035     * L ( ( 1 - P(piton.end_escape_math) ) ^ 1 )
2036     * Lc "$"
2037     * P ( piton.end_escape_math )
2038 end

```

The basic syntactic LPEG

```
2039 local alpha , digit = lpeg.alpha , lpeg.digit
2040 local space = P " "
```

Remember that, for LPEG, the Unicode characters such as à, â, ç, etc. are in fact strings of length 2 (2 bytes) because lpeg is not Unicode-aware.

```
2041 local letter = alpha + "_" + "â" + "à" + "ç" + "é" + "è" + "ê" + "ë" + "ï" + "î"
2042               + "ô" + "û" + "ü" + "Å" + "Ä" + "Ç" + "É" + "È" + "Ê" + "Ë"
2043               + "Ī" + "Ĭ" + "Ō" + "Ū" + "Ū"
2044
2045 local alphanum = letter + digit
```

The following LPEG `identifier` is a mere pattern (that is to say more or less a regular expression) which matches the Python identifiers (hence the name).

```
2046 local identifier = letter * alphanum ^ 0
```

On the other hand, the LPEG `Identifier` (with a capital) also returns a *capture*.

```
2047 local Identifier = K ( 'Identifier.Internal' , identifier )
```

By convention, we will use names with an initial capital for LPEG which return captures.

Here is the first use of our function `K`. That function will be used to construct LPEG which capture Python chunks for which we have a dedicated `piton` style. For example, for the numbers, `piton` provides a style which is called `Number`. The name of the style is provided as a Lua string in the second argument of the function `K`. By convention, we use single quotes for delimiting the Lua strings which are names of `piton` styles (but this is only a convention).

```
2048 local Number =
2049   K ( 'Number.Internal' ,
2050     ( digit ^ 1 * P "." * # ( 1 - P "." ) * digit ^ 0
2051       + digit ^ 0 * P "." * digit ^ 1
2052       + digit ^ 1 )
2053     * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
2054     + digit ^ 1
2055   )
```

We will now define the LPEG `Word`.

We have a problem in the following LPEG because, obviously, we should adjust the list of symbols with the delimiters of the current language (no?).

```
2056 local lpeg_central = 1 - S " '\r[({}])" - digit
```

We recall that `piton.begin_escape` and `piton.end_escape` are Lua strings corresponding to the keys `begin-escape` and `end-escape`.

```
2057 if piton.begin_escape then
2058   lpeg_central = lpeg_central - piton.begin_escape
2059 end
2060 if piton.begin_escape_math then
2061   lpeg_central = lpeg_central - piton.begin_escape_math
2062 end
2063 local Word = Q ( lpeg_central ^ 1 )

2064 local Space = Q " " ^ 1
2065
2066 local SkipSpace = Q " " ^ 0
2067
2068 local Punct = Q ( S ".,:;! " )
2069
2070 local Tab = "\t" * Lc [ [ \@@_tab: ] ]
```

Remember that `\@@_leading_space:` does *not* create a space, only an incrementation of the counter `\g_@@_indentation_int`.

```
2071 local SpaceIndentation = Lc [[ \@@_leading_space: ]] * Q " "
```

```
2072 local Delim = Q ( S "[({})]" )
```

The following LPEG catches a space (U+0020) and replace it by `\l_@@_space_in_string_tl`. It will be used in the strings. Usually, `\l_@@_space_in_string_tl` will contain a space and therefore there won't be any difference. However, when the key `show-spaces-in-strings` is in force, `\l_@@_space_in_string_tl` will contain `␣` (U+2423) in order to visualize the spaces.

```
2073 local SpaceInString = space * Lc [[ \l_@@_space_in_string_tl ]]
```

10.3.3 The option 'detected-commands' and al.

We create four Lua tables called `detected_commands`, `raw_detected_commands`, `beamer_commands` and `beamer_environments`.

On the TeX side, the corresponding data have first been stored as clists.

Then, in a `\AtBeginDocument`, they have been converted in “toks registers” of TeX.

Now, on the Lua side, we are able to access to those “toks registers” with the special pseudo-table `tex.toks` of LuaTeX.

Remark that we can safely use `explode('')` to convert such “toks registers” in Lua tables since, in a clist of L3, there is no empty component and, for each component, there is no space on both sides (the `explode` of the Lua of LuaTeX is unable to do itself such purification of the components).

```
2074 local detected_commands = tex.toks.PitonDetectedCommands : explode ( '','' )
```

```
2075 local raw_detected_commands = tex.toks.PitonRawDetectedCommands : explode ( '','' )
```

```
2076 local beamer_commands = tex.toks.PitonBeamerCommands : explode ( '','' )
```

```
2077 local beamer_environments = tex.toks.PitonBeamerEnvironments : explode ( '','' )
```

We will also create some LPEG.

According to our conventions, a LPEG with a name in camelCase is a LPEG which doesn't do any capture.

```
2078 local detectedCommands = P ( false )
```

```
2079 for _ , x in ipairs ( detected_commands ) do
```

```
2080     detectedCommands = detectedCommands + P ( "\\\" .. x )
```

```
2081 end
```

Further, we will have a LPEG called `DetectedCommands` (in PascalCase) which will be a LPEG *with* captures.

```
2082 local rawDetectedCommands = P ( false )
```

```
2083 for _ , x in ipairs ( raw_detected_commands ) do
```

```
2084     rawDetectedCommands = rawDetectedCommands + P ( "\\\" .. x )
```

```
2085 end
```

```
2086 local beamerCommands = P ( false )
```

```
2087 for _ , x in ipairs ( beamer_commands ) do
```

```
2088     beamerCommands = beamerCommands + P ( "\\\" .. x )
```

```
2089 end
```

```
2090 local beamerEnvironments = P ( false )
```

```
2091 for _ , x in ipairs ( beamer_environments ) do
```

```
2092     beamerEnvironments = beamerEnvironments + P ( x )
```

```
2093 end
```

```
2094 local beamerBeginEnvironments =
```

```
2095     ( space ^ 0 *
```

```
2096         L
```

```
2097             (
```

```
2098                 P [[\begin{]] * beamerEnvironments * "]"
```

```
2099                 * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
```

```
2100             )
```

```
2101             * "\r"
```

```
2102         ) ^ 0
```

```

2103 local beamerEndEnvironments =
2104     ( space ^ 0 *
2105       L ( P [[\end{}} * beamerEnvironments * "]" )
2106         * "\r"
2107       ) ^ 0

```

Several tools for the construction of the main LPEG

```

2108 local LPEG0 = { }
2109 local LPEG1 = { }
2110 local LPEG2 = { }
2111 local LPEG_cleaner = { }

```

For each language, we will need a pattern to match expressions with balanced braces. Those balanced braces must *not* take into account the braces present in strings of the language. However, the syntax for the strings is language-dependent. That's why we write a Lua function `Compute_braces` which will compute the pattern by taking in as argument a pattern for the strings of the language (at least the shorts strings). The argument of `Compute_braces` must be a pattern *which does no catching*.

```

2112 local Compute_braces
2113 function Compute_braces ( lpeg_string ) return
2114     P { "E" ,
2115       E =
2116         (
2117           "{" * V "E" * "}"
2118         +
2119           lpeg_string
2120         +
2121           ( 1 - S "{" )
2122         ) ^ 0
2123       }
2124 end

```

The following Lua function will compute the lpeg `DetectedCommands` which is a LPEG with captures.

```

2125 local Compute_DetectedCommands
2126 function Compute_DetectedCommands ( lang , braces ) return
2127     Ct (
2128       Cc "Open"
2129       * C ( detectedCommands * space ^ 0 * P "{" )
2130       * Cc "}"
2131     )
2132     * ( braces
2133       / ( function ( s )
2134           if s ~= '' then return
2135             LPEG1[lang] : match ( s )
2136           end
2137         end )
2138     )
2139     * P "}"
2140     * Ct ( Cc "Close" )
2141 end

2142 local Compute_RawDetectedCommands
2143 function Compute_RawDetectedCommands ( lang , braces ) return
2144     Ct ( C ( rawDetectedCommands * space ^ 0 * P "{" * braces * P "}" ) )
2145 end

2146 local Compute_LPEG_cleaner
2147 function Compute_LPEG_cleaner ( lang , braces ) return
2148     Ct ( ( ( detectedCommands + rawDetectedCommands ) * "{"
2149           * ( braces

```

```

2150         / ( function ( s )
2151             if s ~= '' then return
2152                 LPEG_cleaner[lang] : match ( s )
2153             end
2154         end )
2155     )
2156     * "}"
2157     + EscapeClean
2158     + C ( P ( 1 ) )
2159     ) ^ 0 ) / table.concat
2160 end

```

The following function `ParseAgain` will be used in the definitions of the LPEG of the different computer languages when we will need to *parse again* a small chunk of code. It's a way to avoid the use of a actual *grammar* of LPEG (in a sens, a recursive regular expression).

Remark that there is no `piton` style associated to a chunk of code which is analyzed by `ParseAgain`. If we wish a `piton` style available to the final user (if he wish to format that element with a uniform font instead of an analyze by `ParseAgain`), we have to use `\@@_piton:n`.

```

2161 local ParseAgain
2162 function ParseAgain ( code )
2163     if code ~= '' then return

```

The variable `piton.language` is set in the function `piton.Parse`.

```

2164     LPEG1[piton.language] : match ( code )
2165 end
2166 end

```

Constructions for Beamer If the class `Beamer` is used, some environments and commands of `Beamer` are automatically detected in the listings of `piton`.

```

2167 local Beamer = P ( false )

```

The following Lua function will be used to compute the LPEG `Beamer` for each computer language. According to our conventions, the LPEG `Beamer`, with its name in `PascalCase` does captures.

```

2168 local Compute_Beamer
2169 function Compute_Beamer ( lang , braces )

```

We will compute in `lpeg` the LPEG that we will return.

```

2170     local lpeg = L ( P [[\pause]] * ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1 )
2171     lpeg = lpeg +
2172         Ct ( Cc "Open"
2173             * C ( beamerCommands
2174                 * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2175                 * P "{"
2176             )
2177             * Cc "}"
2178         )
2179     * ( braces /
2180         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2181     * "]"
2182     * Ct ( Cc "Close" )

```

For the command `\alt`, the specification of the overlays (between angular brackets) is mandatory.

```

2183     lpeg = lpeg +
2184     L ( P [[\alt]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
2185     * ( braces /
2186         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2187     * L ( P "}{{" )
2188     * ( braces /
2189         ( function ( s ) if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2190     * L ( P "}" )

```

For `\temporal`, the specification of the overlays (between angular brackets) is mandatory.

```

2191 lpeg = lpeg +
2192   L ( P [[\temporal]] * "<" * ( 1 - P ">" ) ^ 0 * ">{" )
2193   * ( braces
2194     / ( function ( s )
2195       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2196   * L ( P "}{" )
2197   * ( braces
2198     / ( function ( s )
2199       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2200   * L ( P "}" )
2201   * ( braces
2202     / ( function ( s )
2203       if s ~= '' then return LPEG1[lang] : match ( s ) end end ) )
2204   * L ( P "}" )

```

Now, the environments of Beamer.

```

2205 for _ , x in ipairs ( beamer_environments ) do
2206   lpeg = lpeg +
2207     Ct ( Cc "Open"
2208       * C (
2209         P ( [[\begin{]] .. x .. "]" )
2210         * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
2211       )
2212       * Cc ( [[\end{]] .. x .. "]" )
2213     )
2214     * (
2215       ( ( 1 - P ( [[\end{]] .. x .. "]" ) ) ^ 0 )
2216       / ( function ( s )
2217         if s ~= '' then return
2218           LPEG1[lang] : match ( s )
2219         end
2220       end )
2221     )
2222     * P ( [[\end{]] .. x .. "]" )
2223     * Ct ( Cc "Close" )
2224 end

```

Now, you can return the value we have computed.

```

2225 return lpeg
2226 end

```

The following LPEG is in relation with the key `math-comments`. It will be used in all the languages.

```

2227 local CommentMath =
2228   P "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * P "$" -- $

```

EOL The following LPEG will detect the Python prompts when the user is typesetting an interactive session of Python (directly or through `{pyconsole}` of `pyluatex`). We have to detect that prompt twice. The first detection (called *hasty detection*) will be before the `\@@_begin_line:` because you want to trigger a special background color for that row (and, after the `\@@_begin_line:`, it's too late to change de background).

```

2229 local PromptHastyDetection =
2230   ( # ( P ">>>" + "... " ) * Lc [[ \@@_prompt: ]] ) ^ -1

```

We remind that the marker `#` of LPEG specifies that the pattern will be detected but won't consume any character.

With the following LPEG, a style will actually be applied to the prompt (for instance, it's possible to decide to discard these prompts).

```

2231 local Prompt =
2232   K ( 'Prompt' , ( ( P ">>>" + "... " ) * P " " ^ -1 + P ( true ) ) ) ^ -1

```

The `P (true)` at the end is mandatory because we want the style to be *always* applied, even with an empty argument, in order, for example to add a “false” prompt marker with the tuning:

```
\SetPitonStyle{ Prompt = >>>\space }
```

The following LPEG EOL is for the end of lines.

```
2233 local EOL =
2234   P "\r"
2235   *
2236   (
2237     space ^ 0 * -1
2238     +
```

We recall that each line of the informatic code we have to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁵.

```
2239   Ct (
2240     Cc "EOL"
2241     *
2242     Ct ( Lc [[ \@@_end_line: ]]
2243           * beamerEndEnvironments
2244           *
2245           (
```

If the last line of the listing is the end of an environment of Beamer (eg. `\end{uncoverenv}`), then, we don’t open a new line. A token `\@@_end_line:` will be added at the end of the environment but it will be no-op since we have defined the macro `\@@_end_line:` to be no-op (even though it is also used as a marker for the TeX delimited macro `\@@_begin_line:`).

```
2246             -1
2247             +
2248             beamerBeginEnvironments
2249             * PromptHastyDetection
2250             * Lc [[ \@@_newline:\@@_begin_line: ]]
2251             * Prompt
2252           )
2253         )
2254       )
2255     )
2256     * ( SpaceIndentation ^ 0 * # ( 1 - S "\r" ) ) ^ -1
```

The following LPEG `CommentLaTeX` is for what is called in that document the “LaTeX comments”. Since the elements that will be caught must be sent to LaTeX with standard LaTeX catcodes, we put the capture (done by the function `C`) in a table (by using `Ct`, which is an alias for `lpeg.Ct`).

```
2257 local CommentLaTeX =
2258   P ( piton.comment_latex )
2259   * Lc [[{\PitonStyle{Comment.LaTeX}{\ignorespaces}}]
2260   * L ( ( 1 - P "\r" ) ^ 0 )
2261   * Lc "}"
2262   * ( EOL + -1 )
```

10.3.4 The language Python

We open a Lua local scope for the language Python (of course, there will be also global definitions).

```
2263 do
```

³⁵Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

Some strings of length 2 are explicit because we want the corresponding ligatures available in some fonts such as *Fira Code* to be active.

```

2264 local Operator =
2265     K ( 'Operator' ,
2266         P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + "!=" + "://" + "**"
2267         + S "--+/*%=<>&.@|" )
2268
2269 local OperatorWord =
2270     K ( 'Operator.Word' , P "in" + "is" + "and" + "or" + "not" )

```

The keyword `in` in a construction such as “`for i in range(n)`” must be formatted as a keyword and not as an `Operator.Word` and that’s why we write the following LPEG `For`.

```

2271 local For = K ( 'Keyword' , P "for" )
2272     * Space
2273     * Identifier
2274     * Space
2275     * K ( 'Keyword' , P "in" )
2276
2277 local Keyword =

2315         "ConnectionRefusedError" + "ConnectionResetError" + "FileExistsError" +
2316         "FileNotFoundError" + "InterruptedError" + "IsADirectoryError" +
2317         "NotADirectoryError" + "PermissionError" + "ProcessLookupError" +
2318         "TimeoutError" + "StopAsyncIteration" + "ModuleNotFoundError" +
2319         "RecursionError" )
2320
2321 local RaiseException = K ( 'Keyword' , P "raise" ) * SkipSpace * Exception * Q "("

```

In Python, a “decorator” is a statement whose begins by @ which patches the function defined in the following statement.

```
2322 local Decorator = K ( 'Name.Decorator' , P "@" * letter ^ 1 )
```

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```
2323 local DefClass =
2324 K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )
```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The following LPEG ImportAs is used for the lines beginning by `import`. We have to detect the potential keyword `as` because both the name of the module and its alias must be formatted with the piton style Name.Namespace.

Example: `import numpy as np`

Moreover, after the keyword `import`, it’s possible to have a comma-separated list of modules (if the keyword `as` is not used).

Example: `import math, numpy`

```
2325 local ImportAs =
2326 K ( 'Keyword' , "import" )
2327 * Space
2328 * K ( 'Name.Namespace' , identifier * ( "." * identifier ) ^ 0 )
2329 * (
2330   ( Space * K ( 'Keyword' , "as" ) * Space
2331     * K ( 'Name.Namespace' , identifier ) )
2332   +
2333   ( SkipSpace * Q "," * SkipSpace
2334     * K ( 'Name.Namespace' , identifier ) ) ^ 0
2335 )
```

Be careful: there is no commutativity of + in the previous expression.

The LPEG FromImport is used for the lines beginning by `from`. We need a special treatment because the identifier following the keyword `from` must be formatted with the piton style Name.Namespace and the following keyword `import` must be formatted with the piton style Keyword and must *not* be caught by the LPEG ImportAs.

Example: `from math import pi`

```
2336 local FromImport =
2337 K ( 'Keyword' , "from" )
2338 * Space * K ( 'Name.Namespace' , identifier )
2339 * Space * K ( 'Keyword' , "import" )
```

The strings of Python For the strings in Python, there are four categories of delimiters (without counting the prefixes for f-strings and raw strings). We will use, in the names of our LPEG, prefixes to distinguish the LPEG dealing with that categories of strings, as presented in the following tabular.

	Single	Double
Short	'text'	"text"
Long	'''test'''	"""text"""

We have also to deal with the interpolations in the f-strings. Here is an example of a f-string with an interpolation and a format instruction³⁶ in that interpolation:

```
\piton{f'Total price: {total+1:.2f} €'}
```

The interpolations beginning by % (even though there is more modern techniques now in Python).

```
2340 local PercentInterpol =
2341   K ( 'String.Interpol' ,
2342     P "%"
2343     * ( "(" * alphanum ^ 1 * ")" ) ^ -1
2344     * ( S "-#0 +" ) ^ 0
2345     * ( digit ^ 1 + "*" ) ^ -1
2346     * ( "." * ( digit ^ 1 + "*" ) ) ^ -1
2347     * ( S "HLL" ) ^ -1
2348     * S "sdfFeExXorgiGauc%"
2349   )
```

We can now define the LPEG for the four kinds of strings. It's not possible to use our function K because of the interpolations which must be formatted with another piton style that the rest of the string.³⁷

```
2350 local SingleShortString =
2351   WithStyle ( 'String.Short.Internal' ,
```

First, we deal with the f-strings of Python, which are prefixed by f or F.

```
2352   Q ( P "f'" + "F'" )
2353   * (
2354     K ( 'String.Interpol' , "{" )
2355     * K ( 'Interpol.Inside' , ( 1 - S "}':" ) ^ 0 )
2356     * Q ( P ":" * ( 1 - S "}':" ) ^ 0 ) ^ -1
2357     * K ( 'String.Interpol' , "}" )
2358     +
2359     SpaceInString
2360     +
2361     Q ( ( P "\\'" + "\\\\" + "{{" + "}}" + 1 - S " {}'" ) ^ 1 )
2362   ) ^ 0
2363   * Q ""
2364   +
```

Now, we deal with the standard strings of Python, but also the “raw strings”.

```
2365   Q ( P "'" + "r'" + "R'" )
2366   * ( Q ( ( P "\\'" + "\\\\" + 1 - S " 'r%" ) ^ 1 )
2367     + SpaceInString
2368     + PercentInterpol
2369     + Q "%"
2370   ) ^ 0
2371   * Q "" )

2372 local DoubleShortString =
2373   WithStyle ( 'String.Short.Internal' ,
2374     Q ( P "f\\" + "F\\" )
2375     * (
2376       K ( 'String.Interpol' , "{" )
2377       * K ( 'Interpol.Inside' , ( 1 - S "}\\':" ) ^ 0 )
2378       * ( K ( 'String.Interpol' , ":" ) * Q ( ( 1 - S "}\\':" ) ^ 0 ) ) ^ -1
2379       * K ( 'String.Interpol' , "}" )
2380     +
2381     SpaceInString
2382     +
2383     Q ( ( P "\\\\" + "\\\\" + "{{" + "}" + 1 - S " {}\\" ) ^ 1 )
```

³⁶There is no special piton style for the formatting instruction (after the colon): the style which will be applied will be the style of the encompassing string, that is to say `String.Short` or `String.Long`.

³⁷The interpolations are formatted with the piton style `Interpol.Inside`. The initial value of that style is `\\@@_piton:n` which means that the interpolations are parsed once again by piton.

```

2384         ) ^ 0
2385     * Q "\"
2386 +
2387     Q ( P "\" + "r\" + "R\" )
2388     * ( Q ( ( P "\\\" + "\\\" + 1 - S " \"r%\" ) ^ 1 )
2389         + SpaceInString
2390         + PercentInterpol
2391         + Q \"%\"
2392     ) ^ 0
2393     * Q "\" )
2394
2395 local ShortString = SingleShortString + DoubleShortString

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

2396 local braces =
2397     Compute_braces
2398     (
2399         ( P "\" + "r\" + "R\" + "f\" + "F\" )
2400         * ( P '\\\" + 1 - S "\" ) ^ 0 * "\"
2401     +
2402         ( P '\'' + 'r\'' + 'R\'' + 'f\'' + 'F\'' )
2403         * ( P '\\\'' + 1 - S '\'' ) ^ 0 * '\''
2404     )
2405
2406 if piton.beamer then Beamer = Compute_Beamer ( 'python' , braces ) end

```

Detected commands

```

2407 DetectedCommands = Compute_DetectedCommands ( 'python' , braces )
2408     + Compute_RawDetectedCommands ( 'python' , braces )

```

LPEG_cleaner

```

2409 LPEG_cleaner.python = Compute_LPEG_cleaner ( 'python' , braces )

```

The long strings

```

2410 local SingleLongString =
2411     WithStyle ( 'String.Long.Internal' ,
2412         ( Q ( S "fF" * P "''''\" )
2413             * (
2414                 K ( 'String.Interpol' , "{" )
2415                 * K ( 'Interpol.Inside' , ( 1 - S "}:\" - "''''\" ) ^ 0 )
2416                 * Q ( P ":" * ( 1 - S "}:\" - "''''\" ) ^ 0 ) ^ -1
2417                 * K ( 'String.Interpol' , "}" )
2418             +

```

```

2430         P "%"
2431         +
2432         EOL
2433     ) ^ 0
2434 )
2435 * Q "'" )
2436 local DoubleLongString =
2437     WithStyle ( 'String.Long.Internal' ,
2438     (
2439         Q ( S "fF" * "\"\"" )
2440         * (
2441             K ( 'String.Interpol', "{" )
2442             * K ( 'Interpol.Inside' , ( 1 - S "}:\"r" - "\"\"" ) ^ 0 )
2443             * Q ( ":" * ( 1 - S "}:\"r" - "\"\"" ) ^ 0 ) ^ -1
2444             * K ( 'String.Interpol' , "}" )
2445             +
2446             Q ( ( 1 - S "{}\"r" - "\"\"" ) ^ 1 )
2447             +
2448             EOL
2449         ) ^ 0
2450         +
2451         Q ( S "rR" ^ -1 * "\"\"" )
2452         * (
2453             Q ( ( 1 - P "\"\"" - S "%\"r" ) ^ 1 )
2454             +
2455             PercentInterpol
2456             +
2457             P "%"
2458             +
2459             EOL
2460         ) ^ 0
2461     )
2462     * Q "\"\""
2463 )
2464 local LongString = SingleLongString + DoubleLongString

```

We have a LPEG for the Python docstrings. That LPEG will be used in the LPEG `DefFunction` which deals with the whole preamble of a function definition (which begins with `def`).

```

2465 local StringDoc =
2466     K ( 'String.Doc.Internal' , P "r" ^ -1 * "\"\"" )
2467     * ( K ( 'String.Doc.Internal' , ( 1 - P "\"\"" - "\"r" ) ^ 0 ) * EOL
2468         * Tab ^ 0
2469     ) ^ 0
2470     * K ( 'String.Doc.Internal' , ( 1 - P "\"\"" - "\"r" ) ^ 0 * "\"\"" )

```

The comments in the Python listings We define different LPEG dealing with comments in the Python listings.

```

2471 local Comment =
2472     WithStyle
2473     ( 'Comment.Internal' ,
2474     Q "#" * ( CommentMath + Q ( ( 1 - S "$\"r" ) ^ 1 ) ) ^ 0 -- $
2475     )
2476     * ( EOL + -1 )

```

DefFunction The following LPEG `expression` will be used for the parameters in the *argspec* of a Python function. It's necessary to use a *grammar* because that pattern mainly checks the correct nesting of the delimiters (and it's known in the theory of formal languages that this can't be done with regular expressions *stricto sensu* only).

```

2477 local expression =
2478   P { "E" ,
2479     E = ( "'" * ( P "\\'" + 1 - S "'\r" ) ^ 0 * "'"
2480       + "\" * ( P "\\\"" + 1 - S "\"\r" ) ^ 0 * "\""
2481       + "{" * V "F" * "}"
2482       + "(" * V "F" * ")"
2483       + "[" * V "F" * "]"
2484       + ( 1 - S "{}()[]\r," ) ^ 0 ,
2485     F = ( "{" * V "F" * "}"
2486       + "(" * V "F" * ")"
2487       + "[" * V "F" * "]"
2488       + ( 1 - S "{}()[]\r\''" ) ^ 0
2489   }

```

We will now define a LPEG `Params` that will catch the list of parameters (that is to say the *argspec*) in the definition of a Python function. For example, in the line of code

```
def MyFunction(a,b,x=10,n:int): return n
```

the LPEG `Params` will be used to catch the chunk `a,b,x=10,n:int`.

```

2490 local Params =
2491   P { "E" ,
2492     E = ( V "F" * ( Q "," * V "F" ) ^ 0 ) ^ -1 ,
2493     F = SkipSpace * ( Identifier + Q "*args" + Q "**kwargs" ) * SkipSpace
2494       * (
2495         K ( 'InitialValues' , "=" * expression )
2496         + Q ":" * SkipSpace * K ( 'Name.Type' , identifier )
2497       ) ^ -1
2498   }

```

The following LPEG `DefFunction` catches a keyword `def` and the following name of function *but also everything else until a potential docstring*. That's why this definition of LPEG must occur (in the file `piton.sty`) after the definition of several other LPEG such as `Comment`, `CommentLaTeX`, `Params`, `StringDoc`...

```

2499 local DefFunction =
2500   K ( 'Keyword' , "def" )
2501   * Space
2502   * K ( 'Name.Function.Internal' , identifier )
2503   * SkipSpace
2504   * Q "(" * Params * Q ")"
2505   * SkipSpace
2506   * ( Q "->" * SkipSpace * K ( 'Name.Type' , identifier ) ) ^ -1
2507   * ( C ( ( 1 - S ":\r" ) ^ 0 ) / ParseAgain )
2508   * Q ":"
2509   * ( SkipSpace
2510     * ( EOL + CommentLaTeX + Comment ) -- in all cases, that contains an EOL
2511     * Tab ^ 0
2512     * SkipSpace
2513     * StringDoc ^ 0 -- there may be additional docstrings
2514   ) ^ -1

```

Remark that, in the previous code, `CommentLaTeX` *must* appear before `Comment`: there is no commutativity of the addition for the *parsing expression grammars* (PEG).

If the word `def` is not followed by an identifier and parenthesis, it will be caught as keyword by the LPEG `Keyword` (useful if, for example, the final user wants to speak of the keyword `def`).

Miscellaneous

```
2515 local ExceptionInConsole = Exception * Q ( ( 1 - P "\r" ) ^ 0 ) * EOL
```

The main LPEG for the language Python

```
2516 local EndKeyword
2517     = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
2518     EscapeMath + -1
```

First, the main loop :

```
2519 local Main =
2520     space ^ 0 * EOL -- faut-il le mettre en commentaire ?
2521     + Space
2522     + Tab
2523     + Escape + EscapeMath

```

Here, we must not put local, of course.

```
2546 LPEG1.python = Main ^ 0
```

We recall that each line in the Python code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁸.

```
2547 LPEG2.python =
2548     Ct (
2549         ( space ^ 0 * "\r" ) ^ -1
2550         * beamerBeginEnvironments
2551         * PromptHastyDetection
2552         * Lc [[ \@@_begin_line: ]]
2553         * Prompt
2554         * SpaceIndentation ^ 0
2555         * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
2556         * -1
2557         * Lc [[ \@@_end_line: ]]
2558     )
```

End of the Lua scope for the language Python.

```
2559 end
```

³⁸Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

10.3.5 The language OCaml

We open a Lua local scope for the language OCaml (of course, there will be also global definitions).

```

2560 do

2561     local SkipSpace = ( Q " " + EOL ) ^ 0
2562     local Space = ( Q " " + EOL ) ^ 1

2563     local braces = Compute_braces ( '\"' * ( 1 - S "\" ) ^ 0 * '\"' )
2564     % \end{macrocode}
2565     %
2566     % \bigskip
2567     % \begin{macrocode}
2568     if piton.beamer then Beamer = Compute_Beamer ( 'ocaml' , braces ) end
2569     DetectedCommands =
2570         Compute_DetectedCommands ( 'ocaml' , braces )
2571         + Compute_RawDetectedCommands ( 'ocaml' , braces )
2572     local Q

```

Usually, the following version of the function Q will be used without the second argument (`strict`), that is to say in a looser way. However, in some circumstances, we will need the “strict” version, for instance in `DefFunction`.

```

2573     function Q ( pattern, strict )
2574         if strict ~= nil then
2575             return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2576         else
2577             return Ct ( Cc ( luatexbase.catcodetables.CatcodeTableOther ) * C ( pattern ) )
2578                 + Beamer + DetectedCommands + EscapeMath + Escape
2579         end
2580     end

2581     local K
2582     function K ( style , pattern, strict ) return
2583         Lc ( [[ {\PitonStyle{ ]] .. style .. "}{" )
2584         * Q ( pattern, strict )
2585         * Lc "}}"
2586     end

2587     local WithStyle
2588     function WithStyle ( style , pattern ) return
2589         Ct ( Cc "Open" * Cc ( [[ {\PitonStyle{ ]] .. style .. "}{" ) * Cc "}" )
2590         * (pattern + Beamer + DetectedCommands + EscapeMath + Escape)
2591         * Ct ( Cc "Close" )
2592     end

```

The following LPEG corresponds to the balanced expressions (balanced according to the parenthesis). Of course, we must write $(1 - S "(")$ with outer parenthesis.

```

2593     local balanced_parens =
2594         P { "E" , E = ( "(" * V "E" * ")" + ( 1 - S "(" ) ) ^ 0 }

```

The strings of OCaml

```

2595     local ocaml_string =
2596         P "\"
2597         * (
2598             P " "
2599             +
2600             P ( ( 1 - S "\"\r" ) ^ 1 )
2601             +
2602             EOL -- ?
2603         ) ^ 0
2604     * P "\"

```

```

2605 local String =
2606   WithStyle
2607     ( 'String.Long.Internal' ,
2608       Q "\""
2609       * (
2610         SpaceInString
2611         +
2612         Q ( ( 1 - S " \"\r" ) ^ 1 )
2613         +
2614         EOL
2615       ) ^ 0
2616       * Q "\""
2617     )

```

Now, the “quoted strings” of OCaml (for example {`ext`|`Essai`|`ext`}).

For those strings, we will do two consecutive analysis. First an analysis to determine the whole string and, then, an analysis for the potential visual spaces and the EOL in the string.

The first analysis require a match-time capture. For explanations about that programmation, see the paragraphe *Lua’s long strings* in www.inf.puc-rio.br/~roberto/lpeg.

```

2618 local ext = ( R "az" + "_" ) ^ 0
2619 local open = "{" * Cg ( ext , 'init' ) * "/"
2620 local close = "/" * C ( ext ) * "}"
2621 local closeeq =
2622   Cmt ( close * Cb ( 'init' ) ,
2623     function ( s , i , a , b ) return a == b end )

```

The LPEG QuotedStringBis will do the second analysis.

```

2624 local QuotedStringBis =
2625   WithStyle ( 'String.Long.Internal' ,
2626     (
2627       Space
2628       +
2629       Q ( ( 1 - S " \r" ) ^ 1 )
2630       +
2631       EOL
2632     ) ^ 0 )

```

We use a “function capture” (as called in the official documentation of the LPEG) in order to do the second analysis on the result of the first one.

```

2633 local QuotedString =
2634   C ( open * ( 1 - closeeq ) ^ 0 * close ) /
2635   ( function ( s ) return QuotedStringBis : match ( s ) end )

```

In OCaml, the delimiters for the comments are (* and *). There are unsymmetrical and OCaml allows those comments to be nested. That’s why we need a grammar.

In these comments, we embed the math comments (between \$ and \$) and we embed also a treatment for the end of lines (since the comments may be multi-lines).

```

2636 local comment =
2637   P {
2638     "A" ,
2639     A = Q "(*"
2640       * ( V "A"
2641         + Q ( ( 1 - S "\r$\\"" - "(*" - "*)" ) ^ 1 ) -- $
2642         + ocaml_string
2643         + "$" * K ( 'Comment.Math' , ( 1 - S "$\r" ) ^ 1 ) * "$" -- $
2644         + EOL
2645       ) ^ 0
2646       * Q "*)"
2647   }
2648 local Comment = WithStyle ( 'Comment.Internal' , comment )

```

Some standard LPEG

```
2649 local Delim = Q ( P "[" + "]" + S "[]" )
2650 local Punct = Q ( S ",:;! " )
```

The identifiers caught by `cap_identifier` begin with a capital. In OCaml, it's used for the constructors of types and for the names of the modules.

```
2651 local cap_identifier = R "AZ" * ( R "az" + R "AZ" + S "_" + digit ) ^ 0

2652 local Constructor =
2653   K ( 'Name.Constructor' ,
2654     Q "`" ^ -1 * cap_identifier
```

We consider `::` and `[]` as constructors (of the lists) as does the Tuareg mode of Emacs.

```
2655   + Q "::"
2656   + Q ( "[" , true ) * SkipSpace * Q ( "]" , true )

2657 local ModuleType = K ( 'Name.Type' , cap_identifier )

2658 local OperatorWord =
2659   K ( 'Operator.Word' ,
2660     P "asr" + "land" + "lor" + "lsl" + "lxor" + "mod" + "or" + "not" )
```

In OCaml, some keywords are considered as *governing keywords* with some special syntactic characteristics.

```
2661 local governing_keyword = P "and" + "begin" + "class" + "constraint" +
2662   "end" + "external" + "functor" + "include" + "inherit" + "initializer" +
2663   "in" + "let" + "method" + "module" + "object" + "open" + "rec" + "sig" +
2664   "struct" + "type" + "val"

2665 local Keyword =
2666   K ( 'Keyword' ,
2667     P "assert" + "as" + "done" + "downto" + "do" + "else" + "exception"
2668     + "for" + "function" + "fun" + "if" + "lazy" + "match" + "mutable"
2669     + "new" + "of" + "private" + "raise" + "then" + "to" + "try"
2670     + "virtual" + "when" + "while" + "with" )
2671   + K ( 'Keyword.Constant' , P "true" + "false" )
2672   + K ( 'Keyword.Governing' , governing_keyword )

2673 local EndKeyword
2674   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape
2675   + EscapeMath + -1
```

Now, the identifier. Recall that we have also a LPEG `cap_identifier` for the identifiers beginning with a capital letter.

```
2676 local identifier = ( R "az" + "_" ) * ( R "az" + R "AZ" + S "_" + digit ) ^ 0
2677   - ( OperatorWord + Keyword ) * EndKeyword
```

We have the internal style `Identifier.Internal` in order to be able to implement the mechanism `\SetPitonIdentifier`. The final user has access to a style called `Identifier`.

```
2678 local Identifier = K ( 'Identifier.Internal' , identifier )
```

In OCaml, *character* is a type different of the type `string`.

```

2679 local ocaml_char =
2680   P "" *
2681   (
2682     ( 1 - S "\\\" )
2683     + "\\\"
2684     * ( S "\\ntbr \"
2685         + digit * digit * digit
2686         + P "x" * ( digit + R "af" + R "AF" )
2687                   * ( digit + R "af" + R "AF" )
2688                   * ( digit + R "af" + R "AF" )
2689         + P "o" * R "03" * R "07" * R "07" )
2690   )
2691   * ""
2692 local Char =
2693   K ( 'String.Short.Internal', ocaml_char )

```

For the parameter of the types (for example : ``\a` as in ``a` list).

```

2694 local TypeParameter =
2695   K ( 'TypeParameter' ,
2696       "" * Q "_" ^ -1 * alpha ^ 1 * digit ^ 0 * ( # ( 1 - P "" ) + -1 ) )

```

DotNotation Now, we deal with the notations with points (eg: `List.length`). In OCaml, such notation is used for the fields of the records and for the modules.

```

2697 local DotNotation =
2698   (
2699     K ( 'Name.Module' , cap_identifier )
2700     * Q "."
2701     * ( Identifier + Constructor + Q "(" + Q "[" + Q "{" ) ^ -1
2702     +
2703     Identifier
2704     * Q "."
2705     * K ( 'Name.Field' , identifier )
2706   )
2707   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0

```

The records

```

2708 local expression_for_fields_type =
2709   P { "E" ,
2710     E = ( "{" * V "F" * "}"
2711         + "(" * V "F" * ")"
2712         + TypeParameter
2713         + ( 1 - S "{}()[]\r;" ) ) ^ 0 ,
2714     F = ( "{" * V "F" * "}"
2715         + "(" * V "F" * ")"
2716         + ( 1 - S "{}()[]\r\"" ) + TypeParameter ) ^ 0
2717   }

```

```

2718 local expression_for_fields_value =
2719   P { "E" ,
2720     E = ( "{" * V "F" * "}"
2721         + "(" * V "F" * ")"
2722         + "[" * V "F" * "]"
2723         + ocaml_string + ocaml_char
2724         + ( 1 - S "{}()[];" ) ) ^ 0 ,
2725     F = ( "{" * V "F" * "}"
2726         + "(" * V "F" * ")"
2727         + "[" * V "F" * "]"
2728         + ocaml_string + ocaml_char
2729         + ( 1 - S "{}()[]\\"" ) ) ^ 0
2730   }

```

```

2731 local OneFieldDefinition =

2778     Identifier
2779     * Q "."
2780     * K ( 'Name.Field' , identifier )
2781   )
2782   * ( Q "." * K ( 'Name.Field' , identifier ) ) ^ 0

```

```

2783 local Operator =
2784   K ( 'Operator' ,
2785     P "!=" + "<>" + "==" + "<<" + ">>" + "<=" + ">=" + "==" + "||" + "&&" +
2786     "/" + "*" + ";" + ">" + "+" + "-" + "." + "," + "/" +
2787     + S "~+/*%=<>&@|" )

2788 local Builtin =
2789   K ( 'Name.Builtin' , P "incr" + "decr" + "fst" + "snd" + "ref" )

2790 local Exception =
2791   K ( 'Exception' ,
2792     P "Division_by_zero" + "End_of_File" + "Failure" + "Invalid_argument" +
2793     "Match_failure" + "Not_found" + "Out_of_memory" + "Stack_overflow" +
2794     "Sys_blocked_io" + "Sys_error" + "Undefined_recursive_module" )

2795 LPEG_cleaner.ocaml = Compute_LPEG_cleaner ( 'ocaml' , braces )

```

An argument in the definition of a OCaml function may be of the form (pattern:type). pattern may be a single identifier but it's not mandatory. First instance, it's possible to write in OCaml:

```
let head (a::q) = a
```

First, we write a pattern (in the LPEG sens!) to match what will be the pattern (in the OCaml sens).

```

2796 local pattern_part =
2797   ( P "(" * balanced_parens * ")" + ( 1 - S ":( )" ) + P ":@" ) ^ 0

```

For the “type” part, the LPEG-pattern will merely be `balanced_parens`.

We can now write a LPEG `Argument` which catches a argument of function (in the definition of the function).

```
2798 local Argument =
```

The following line is for the labels of the labeled arguments. Maybe we will, in the future, create a style for those elements.

```

2799   ( Q "~" * Identifier * Q ":" * SkipSpace ) ^ -1
2800   *

```

Now, the argument itself, either a single identifier, or a construction between parentheses

```

2801   (
2802     K ( 'Identifier.Internal' , identifier )
2803     +
2804     Q "(" * SkipSpace
2805     * ( C ( pattern_part ) / ParseAgain )
2806     * SkipSpace

```

Of course, the specification of type is optional.

```

2807     * ( Q ":" * #(1- P"=")
2808         * K ( 'TypeExpression' , balanced_parens ) * SkipSpace
2809     ) ^ -1
2810     * Q ")"
2811   )

```

Despite its name, then LPEG `DefFunction` deals also with `let open` which opens locally a module.

```

2812 local DefFunction =
2813   K ( 'Keyword.Governing' , "let open" )
2814   * Space
2815   * K ( 'Name.Module' , cap_identifier )
2816   +
2817   K ( 'Keyword.Governing' , P "let rec" + "let" + "and" )
2818   * Space
2819   * K ( 'Name.Function.Internal' , identifier )
2820   * Space
2821   * (

```

You use here the argument **strict** in order to allow a correct analyse of `let x = \uncover<2->{y}` (elsewhere, it's interpreted as a definition of a OCaml function).

```

2822     Q "=" * SkipSpace * K ( 'Keyword' , "function" , true )
2823     +
2824     Argument * ( SkipSpace * Argument ) ^ 0
2825     * (
2826         SkipSpace
2827         * Q ":" * # ( 1 - P "=" )
2828         * K ( 'TypeExpression' , ( 1 - P "=" ) ^ 0 )
2829     ) ^ -1
2830 )

```

DefModule

```

2831 local DefModule =
2832     K ( 'Keyword.Governing' , "module" ) * Space
2833     *
2834     (
2835         K ( 'Keyword.Governing' , "type" ) * Space
2836         * K ( 'Name.Type' , cap_identifier )
2837     +

3003     * SkipSpace
3004     * # P "("

```

We remind that the marker # of LPEG specifies that the pattern will be detected but won't consume any character.

The following LPEG DefClass will be used to detect the definition of a new class (the name of that new class will be formatted with the piton style Name.Class).

Example: `class myclass:`

```

3005 local DefClass =
3006     K ( 'Keyword' , "class" ) * Space * K ( 'Name.Class' , identifier )

```

If the word `class` is not followed by a identifier, it will be caught as keyword by the LPEG Keyword (useful if we want to type a list of keywords).

The strings of C

```

3007 String =
3008     WithStyle ( 'String.Long.Internal' ,
3009         Q "\""
3010         * ( SpaceInString
3011             + K ( 'String.Interpol' ,
3012                 "%" * ( S "difcspXou" + "ld" + "li" + "hd" + "hi" )
3013             )
3014         + Q ( ( P "\\\"" + 1 - S " \" " ) ^ 1 )
3015         ) ^ 0
3016         * Q "\""
3017     )

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

3018 local braces = Compute_braces ( "\"" * ( 1 - S "\"" ) ^ 0 * "\"" )
3019 if piton.beamer then Beamer = Compute_Beamer ( 'c' , braces ) end
3020 DetectedCommands =
3021   Compute_DetectedCommands ( 'c' , braces )
3022   + Compute_RawDetectedCommands ( 'c' , braces )
3023 LPEG_cleaner.c = Compute_LPEG_cleaner ( 'c' , braces )

```

The directives of the preprocessor

```

3024 local Preproc = K ( 'Preproc' , "#" * ( 1 - P "\r" ) ^ 0 ) * ( EOL + -1 )

```

The comments in the C listings We define different LPEG dealing with comments in the C listings.

```

3025 local Comment =
3026   WithStyle ( 'Comment.Internal' ,
3027     Q "/" * ( CommentMath + Q ( ( 1 - S "$\r" ) ^ 1 ) ) ^ 0 ) -- $
3028     * ( EOL + -1 )
3029
3030 local LongComment =
3031   WithStyle ( 'Comment.Internal' ,
3032     Q "/*"
3033     * ( CommentMath + Q ( ( 1 - P "*/" - S "$\r" ) ^ 1 ) + EOL ) ^ 0
3034     * Q "*/"
3035     ) -- $

```

The main LPEG for the language C

```

3036 local EndKeyword
3037   = Space + Punct + Delim + EOL + Beamer + DetectedCommands + Escape +
3038     EscapeMath + -1

```

First, the main loop :

```

3058   + Identifier
3059   + Number
3060   + Word

```

Here, we must not put `local`, of course.

```

3061 LPEG1.c = Main ^ 0

```

We recall that each line in the C code to parse will be sent back to LaTeX between a pair `\@@_begin_line: - \@@_end_line:`³⁹.

```

3062 LPEG2.c =
3063   Ct (
3064     ( space ^ 0 * P "\r" ) ^ -1
3065     * beamerBeginEnvironments
3066     * Lc [[ \@@_begin_line: ]]
3067     * SpaceIndentation ^ 0
3068     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3069     * -1
3070     * Lc [[ \@@_end_line: ]]
3071   )

```

End of the Lua scope for the language C.

```

3072 end

```

10.3.7 The language SQL

We open a Lua local scope for the language SQL (of course, there will be also global definitions).

```

3073 do

3074   local LuaKeyword
3075   function LuaKeyword ( name ) return
3076     Lc [[ {\PitonStyle{Keyword}{ } }
3077     * Q ( Cmt (
3078       C ( letter * alphanum ^ 0 ) ,
3079       function ( s , i , a ) return string.upper ( a ) == name end
3080     )
3081   )
3082   * Lc "}}"
3083 end

```

In the identifiers, we will be able to catch those contening spaces, that is to say like "last name".

```

3084   local identifier =
3085     letter * ( alphanum + "-" ) ^ 0
3086     + P "'" * ( ( 1 - P "'" ) ^ 1 ) * "'"

3087   local Operator =
3088     K ( 'Operator' , P "=" + "!=" + "<>" + ">=" + ">" + "<=" + "<" + S "*/" )

```

In SQL, the keywords are case-insensitive. That's why we have a little complication. We will catch the keywords with the identifiers and, then, distinguish the keywords with a Lua function. However, some keywords will be caught in special LPEG because we want to detect the names of the SQL tables.

The following function converts a comma-separated list in a “set”, that is to say a Lua table with a fast way to test whether a string belongs to that set (eventually, the indexation of the components of the table is no longer done by integers but by the strings themselves).

```

3089   local Set
3090   function Set ( list )
3091     local set = { }
3092     for _ , l in ipairs ( list ) do set[l] = true end
3093     return set
3094   end

```

³⁹Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

We now use the previous function `Set` to create the “sets” `set_keywords` and `set_builtin`. That list of keywords comes from https://sqlite.org/lang_keywords.html.

```

3095 local set_keywords = Set
3096 {
3097     "ABORT", "ACTION", "ADD", "AFTER", "ALL", "ALTER", "ALWAYS", "ANALYZE",
3098     "AND", "AS", "ASC", "ATTACH", "AUTOINCREMENT", "BEFORE", "BEGIN", "BETWEEN",

3122     "RANK", "ROUND", "RTRIM", "SUBSTRING", "SUM", "UPPER", "YEAR"
3123 }

```

The LPEG Identifier will catch the identifiers of the fields but also the keywords and the built-in functions of SQL. It will *not* catch the names of the SQL tables.

```

3124 local Identifier =
3125   C ( identifier ) /
3126   (
3127     function ( s )
3128       if set_keywords[string.upper(s)] then return

```

Remind that, in Lua, it's possible to return *several* values.

```

3129     { [{\PitonStyle{Keyword}}{[]}] },
3130     { luatexbase.catcodetables.other, s },
3131     { "}" }
3132   else
3133     if set_builtins[string.upper(s)] then return
3134     { [{\PitonStyle{Name.Builtin}}{[]}] },
3135     { luatexbase.catcodetables.other, s },
3136     { "}" }
3137   else return
3138     { [{\PitonStyle{Name.Field}}{[]}] },
3139     { luatexbase.catcodetables.other, s },
3140     { "}" }
3141   end
3142 end
3143 end
3144 )

```

The strings of SQL

```

3145 local String = K ( 'String.Long.Internal' , "" * ( 1 - P "" ) ^ 1 * "" )

```

Beamer The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

3146 local braces = Compute_braces ( "'" * ( 1 - P "'" ) ^ 1 * "'" )
3147 if piton.beamer then Beamer = Compute_Beamer ( 'sql' , braces ) end

3234         * Lc [[ \@@_end_line: ]]
3235     )

```

End of the Lua scope for the language SQL.

```

3236 end

```

10.3.8 The language “Minimal”

We open a Lua local scope for the language “Minimal” (of course, there will be also global definitions).

```

3237 do

```

⁴⁰Remember that the `\@@_end_line:` must be explicit because it will be used as marker in order to delimit the argument of the command `\@@_begin_line:`

```

3238 local Punct = Q ( S ",:;!\\\" )
3239
3240 local Comment =
3241   WithStyle ( 'Comment.Internal' ,
3242     Q "\""
3243     * ( CommentMath + Q ( ( 1 - S "$\r\" ) ^ 1 ) ) ^ 0 -- $
3244     )
3245     * ( EOL + -1 )
3246
3247 local String =
3248   WithStyle ( 'String.Short.Internal' ,
3249     Q "\""
3250     * ( SpaceInString
3251       + Q ( ( P "[\\" ] + 1 - S " \\" ) ^ 1 )
3252       ) ^ 0
3253     * Q "\""
3254     )

```

The argument of `Compute_braces` must be a pattern *which does no catching* corresponding to the strings of the language.

```

3255 local braces = Compute_braces ( P "\"" * ( P "\\\"" + 1 - P "\"" ) ^ 1 * "\"" )
3256
3257 if piton.beamer then Beamer = Compute_Beamer ( 'minimal' , braces ) end
3258
3259 DetectedCommands =
3260   Compute_DetectedCommands ( 'minimal' , braces )
3261   + Compute_RawDetectedCommands ( 'minimal' , braces )
3262
3263 LPEG_cleaner.minimal = Compute_LPEG_cleaner ( 'minimal' , braces )
3264
3265 local identifier = letter * alphanum ^ 0
3266
3267 local Identifier = K ( 'Identifier.Internal' , identifier )
3268

3275   + Escape + EscapeMath
3276   + CommentLaTeX
3277   + Beamer
3278   + DetectedCommands
3279   + Comment
3280   + Delim
3281   + String
3282   + Punct
3283   + Identifier
3284   + Number
3285   + Word

```

Here, we must not put `local`, of course.

```

3286 LPEG1.minimal = Main ^ 0
3287
3288 LPEG2.minimal =
3289   Ct (
3290     ( space ^ 0 * "\r\" ) ^ -1
3291     * beamerBeginEnvironments
3292     * Lc [ [ @@_begin_line: ] ]
3293     * SpaceIndentation ^ 0
3294     * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0

```

```

3295         * -1
3296         * Lc [[ \@@_end_line: ]]
3297     )

```

End of the Lua scope for the language “Minimal”.

```

3298 end

```

10.3.9 The language “Verbatim”

We open a Lua local scope for the language “Verbatim” (of course, there will be also global definitions).

```

3299 do

```

Here, we don’t use `braces` as done with the other languages because we don’t have to take into account the strings (there is no string in the language “Verbatim”).

```

3300     local braces =
3301         P { "E" ,
3302             E = ( "{ " * V "E" * "}" + ( 1 - S "{" ) ) ^ 0
3303         }
3304
3305     if piton.beamer then Beamer = Compute_Beamer ( 'verbatim' , braces ) end
3306
3307     DetectedCommands =
3308         Compute_DetectedCommands ( 'verbatim' , braces )
3309         + Compute_RawDetectedCommands ( 'verbatim' , braces )
3310
3311     LPEG_cleaner.verbatim = Compute_LPEG_cleaner ( 'verbatim' , braces )

```

Now, you will construct the LPEG Word.

```

3312     local lpeg_central = 1 - S " \\r"
3313     if piton.begin_escape then
3314         lpeg_central = lpeg_central - piton.begin_escape
3315     end
3316     if piton.begin_escape_math then
3317         lpeg_central = lpeg_central - piton.begin_escape_math
3318     end
3319     local Word = Q ( lpeg_central ^ 1 )

3322         space ^ 0 * EOL
3323         + Space
3324         + Tab
3325         + Escape + EscapeMath
3326         + Beamer
3327         + DetectedCommands
3328         + Q [[\]]
3329         + Word

```

Here, we must not put `local`, of course.

```

3330     LPEG1.verbatim = Main ^ 0
3331
3332     LPEG2.verbatim =
3333         Ct (
3334             ( space ^ 0 * "\r" ) ^ -1
3335             * beamerBeginEnvironments
3336             * Lc [[ \@@_begin_line: ]]
3337             * SpaceIndentation ^ 0
3338             * ( space ^ 1 * -1 + space ^ 0 * EOL + Main ) ^ 0
3339             * -1
3340             * Lc [[ \@@_end_line: ]]
3341         )

```

End of the Lua scope for the language “`verbatim`”.

```
3342 end
```

10.3.10 The function `Parse`

The function `Parse` is the main function of the package `piton`. It parses its argument and sends back to LaTeX the code with interlaced formatting LaTeX instructions. In fact, everything is done by the LPEG corresponding to the considered language (`LPEG2[language]`) which returns as capture a Lua table containing data to send to LaTeX.

```
3343 function piton.Parse ( language , code )
```

The variable `piton.language` will be used by the function `ParseAgain`.

```
3344 piton.language = language
3345 local t = LPEG2[language] : match ( code )
3346 if t == nil then
3347     sprintL3 [[ \@@_error_or_warning:n { SyntaxError } ]]
3348     return -- to exit in force the function
3349 end
3350 local left_stack = {}
3351 local right_stack = {}
3352 for _ , one_item in ipairs ( t ) do
3353     if one_item[1] == "EOL" then
3354         for _ , s in ipairs ( right_stack ) do
3355             tex.sprint ( s )
3356         end
3357         for _ , s in ipairs ( one_item[2] ) do
3358             tex.tprint ( s )
3359         end
3360         for _ , s in ipairs ( left_stack ) do
3361             tex.sprint ( s )
3362         end
3363     else
```

Here is an example of an item beginning with “Open”.

```
{ "Open" , "\begin{uncover}<2>" , "\end{uncover}" }
```

In order to deal with the ends of lines, we have to close the environment (`{uncover}` in this example) at the end of each line and reopen it at the beginning of the new line. That’s why we use two Lua stacks, called `left_stack` and `right_stack`. `left_stack` will be for the elements like `\begin{uncover}<2>` and `right_stack` will be for the elements like `\end{uncover}`.

```
3364     if one_item[1] == "Open" then
3365         tex.sprint ( one_item[2] )
3366         table.insert ( left_stack , one_item[2] )
3367         table.insert ( right_stack , one_item[3] )
3368     else
3369         if one_item[1] == "Close" then
3370             tex.sprint ( right_stack[#right_stack] )
3371             left_stack[#left_stack] = nil
3372             right_stack[#right_stack] = nil
3373         else
3374             tex.tprint ( one_item )
3375         end
3376     end
3377 end
3378 end
3379 end
```

There is the problem of the conventions of end of lines (`\n` in Unix and Linux but `\r\n` in Windows). The function `cr_file_lines` will read a file line by line after replacement of the `\r\n` by `\n`.

```
3380 local cr_file_lines
```

```

3381 function cr_file_lines ( filename )
3382     local f = io.open ( filename , 'rb' )
3383     local s = f : read ( '*a' )
3384     f : close ( )
3385     return ( s .. '\n' ) : gsub( '\r\n?' , '\n' ) : gmatch ( '(.-)\n' )
3386 end

```

The function `ParseFile` will be used by the LaTeX command `\PitonInputFile`. That function merely reads the file (between `first_line` and `last_line`) and then apply the function `Parse` to the resulting Lua string.

```

3387 function piton.ParseFile
3388     ( lang , name , first_line , last_line , splittable , split )
3389     local s = ''
3390     local i = 0
3391     for line in cr_file_lines ( name ) do
3392         i = i + 1
3393         if i >= first_line then
3394             s = s .. '\r' .. line
3395         end
3396         if i >= last_line then break end
3397     end

```

We extract the BOM of utf-8, if present.

```

3398     if string.byte ( s , 1 ) == 13 then
3399         if string.byte ( s , 2 ) == 239 then
3400             if string.byte ( s , 3 ) == 187 then
3401                 if string.byte ( s , 4 ) == 191 then
3402                     s = string.sub ( s , 5 , -1 )
3403                 end
3404             end
3405         end
3406     end
3407     if split == 1 then
3408         piton.RetrieveGobbleSplitParse ( lang , 0 , splittable , s )
3409     else
3410         piton.RetrieveGobbleParse ( lang , 0 , splittable , s )
3411     end
3412 end

```

```

3413 function piton.ReadFile ( name , first_line , last_line )
3414     local s = ''
3415     local i = 0
3416     for line in cr_file_lines ( name ) do
3417         i = i + 1
3418         if i >= first_line then
3419             s = s .. '\r' .. line
3420         end
3421         if i >= last_line then break end
3422     end
3423     if string.byte ( s , 1 ) == 13 then
3424         if string.byte ( s , 2 ) == 239 then
3425             if string.byte ( s , 3 ) == 187 then
3426                 if string.byte ( s , 4 ) == 191 then
3427                     s = string.sub ( s , 5 , -1 )
3428                 end
3429             end
3430         end
3431     end
3432     sprintL3 ( [[ \tl_set:Nn \l_@@_body_tl { }}] )
3433     tex.sprint ( luatexbase.catcodetables.CatcodeTableOther , s )
3434     sprintL3 ( [[ } ] ] )
3435 end

```

```

3436 function piton.RetrieveGobbleParse ( lang , n , splittable , code )
3437   local s
3438   s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3439   piton.GobbleParse ( lang , n , splittable , s )
3440 end

```

10.3.11 Two variants of the function Parse with integrated preprocessors

The following command will be used by the user command `\piton`. For that command, we have to undo the duplication of the symbols #.

```

3441 function piton.ParseBis ( lang , code )
3442   return piton.Parse ( lang , code : gsub ( '##' , '#' ) )
3443 end

```

The following command will be used when we have to parse some small chunks of code that have yet been parsed. They are re-scanned by LaTeX because it has been required by `\@@_piton:n` in the `piton` style of the syntactic element. In that case, you have to remove the potential `\@@_breakable_space:` that have been inserted when the key `break-lines` is in force.

```

3444 function piton.ParseTer ( lang , code )

```

Be careful: we have to write `[[\@@_breakable_space:]]` with a space after the name of the LaTeX command `\@@_breakable_space:`. Remember that `\@@_leading_space:` does not create a space, only an incrementation of the counter `\g_@@_indentation_int`. That's why we don't replace it by a space...

```

3445   return piton.Parse
3446   (
3447     lang ,
3448     code : gsub ( [[\@@_breakable_space: ]] , ' ' )
3449             : gsub ( [[\@@_leading_space: ]] , '' )
3450   )
3451 end

```

10.3.12 Preprocessors of the function Parse for gobble

We deal now with preprocessors of the function `Parse` which are needed when the “gobble mechanism” is used.

The following LPEG returns as capture the minimal number of spaces at the beginning of the lines of code.

```

3452 local AutoGobbleLPEG =
3453   ( (
3454     P " " ^ 0 * "\r"
3455     +
3456     Ct ( C " " ^ 0 ) / table.getn
3457     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 * "\r"
3458   ) ^ 0
3459   * ( Ct ( C " " ^ 0 ) / table.getn
3460     * ( 1 - P " " ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3461 ) / math.min

```

The following LPEG is similar but works with the tabulations.

```

3462 local TabsAutoGobbleLPEG =
3463   (
3464     (
3465       P "\t" ^ 0 * "\r"
3466       +
3467       Ct ( C "\t" ^ 0 ) / table.getn
3468       * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 * "\r"

```

```

3469         ) ^ 0
3470         * ( Ct ( C "\t" ^ 0 ) / table.getn
3471             * ( 1 - P "\t" ) * ( 1 - P "\r" ) ^ 0 ) ^ -1
3472     ) / math.min

```

The following LPEG returns as capture the number of spaces at the last line, that is to say before the `\end{Piton}` (and usually it's also the number of spaces before the corresponding `\begin{Piton}` because that's the traditional way to indent in LaTeX).

```

3473 local EnvGobbleLPEG =
3474     ( ( 1 - P "\r" ) ^ 0 * "\r" ) ^ 0
3475     * Ct ( C " " ^ 0 * -1 ) / table.getn
3476
3477 local remove_before_cr
3478 function remove_before_cr ( input_string )
3479     local match_result = ( P "\r" ) : match ( input_string )
3480     if match_result then return
3481         string.sub ( input_string , match_result )
3482     else return
3483         input_string
3484     end
3485 end
3486 end

```

The function `gobble` gobbles n characters on the left of the code. The negative values of n have special significations.

```

3485 function piton.Gobble ( n , code )
3486     code = remove_before_cr ( code )
3487     if n == 0 then return
3488         code
3489     else
3490         if n == -1 then
3491             n = AutoGobbleLPEG : match ( code )
3492         end
3493     end
3494 end

```

for the cas of an empty environment (only blank lines)

```

3492     if tonumber(n) then else n = 0 end
3493 else
3494     if n == -2 then
3495         n = EnvGobbleLPEG : match ( code )
3496     else
3497         if n == -3 then
3498             n = TabsAutoGobbleLPEG : match ( code )
3499         end
3500     end
3501 end
3502 end

```

We have a second test `if n == 0` because, even if the key like `auto-gobble` is in force, it's possible that, in fact, there is no space to gobble...

```

3503     if n == 0 then return
3504         code
3505     else return

```

We will now use a LPEG that we have to compute dynamically because it depends on the value of n .

```

3506     ( Ct (
3507         ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3508         * ( C "\r" * ( 1 - P "\r" ) ^ (-n) * C ( ( 1 - P "\r" ) ^ 0 )
3509         ) ^ 0 )
3510     / table.concat
3511     ) : match ( code )
3512 end
3513 end
3514 end

```

In the following code, `n` is the value of `\l_@@_gobble_int`.
`splittable` is the value of `\l_@@_splittable_int`.

```

3515 function piton.GobbleParse ( lang , n , splittable , code )
3516   piton.ComputeLinesStatus ( code , splittable )
3517   piton.last_code = piton.Gobble ( n , code )
3518   piton.last_language = lang

```

We count the number of lines of the informatic code. The result will be stored by Lua in `\l_@@_nb_lines_int`.

```

3519   piton.CountLines ( piton.last_code )
3520   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool { \savenotes } ]]
3521   piton.Parse ( lang , piton.last_code )
3522   sprintL3 [[ \vspace{2.5pt} ]]
3523   sprintL3 [[ \bool_if:NT \g_@@_footnote_bool { \endsavenotes } ]]

```

We finish the paragraph (each line of the listing is composed in a TeX box — with potentially several lines when `break-lines-in-Piton` is in force — put alone in a paragraph.

```

3524   sprintL3 [[ \par ]]
3525   piton.join_and_write ( )
3526 end

```

The following function will be used when the final user has used the key `join` or the key `write`. The value of the key `join` has been written in the Lua variable `piton.join`.

```

3527 function piton.join_and_write ( )
3528   if piton.join ~= '' then
3529     if piton.join_files [ piton.join ] == nil then
3530       piton.join_files [ piton.join ] = piton.get_last_code ( )
3531     else
3532       piton.join_files [ piton.join ] =
3533         piton.join_files [ piton.join ] .. "\r\n" .. piton.get_last_code ( )
3534     end
3535   end
3536   % \end{macrocode}
3537   %
3538   % Now, if the final user has used the key |write| to write the listing of the
3539   % environment on an external file (on the disk).
3540   %
3541   % We have written the values of the keys |write| and |path-write| in the Lua
3542   % variables |piton.write| and |piton.path-write|.
3543   %
3544   % If |piton.write| is not empty, that means that the key |write| has been used
3545   % for the current environment and, hence, we have to write the content of the
3546   % listing on the corresponding external file.
3547   % \begin{macrocode}
3548   if piton.write ~= '' then

```

We will write on `file_name` the full name (with the path) of the file in which we will write.

```

3549     local file_name = ''
3550     if piton.path_write == '' then
3551       file_name = piton.write
3552     else

```

If `piton.path-write` is not empty, that means that we will not write on a file in the current directory but in another directory. First, we verify that that directory actually exists.

```

3553     local attr = lfs.attributes ( piton.path_write )
3554     if attr and attr.mode == "directory" then
3555       file_name = piton.path_write .. "/" .. piton.write
3556     else

```

If the directory does *not* exist, you raise an (non-fatal) error since TeX is not able to create a new directory.

```

3557       sprintL3 [[ \@@_error_or_warning:n { InexistentDirectory } ]]
3558     end
3559   end
3560   if file_name ~= '' then

```

Now, `file_name` contains the complete name of the file on which we will have to write. Maybe the file does not exist but we are sure that the directory exist.

The Lua table `piton.write_files` is a table of Lua strings corresponding to all the files that we will write on the disk in the `\AtEndDocument`. They correspond to the use of the key `write` (and `path-write`).

```

3561     if piton.write_files [ file_name ] == nil then
3562         piton.write_files [ file_name ] = piton.get_last_code ( )
3563     else
3564         piton.write_files [ file_name ] =
3565             piton.write_files [ file_name ] .. "\n" .. piton.get_last_code ( )
3566     end
3567 end
3568 end
3569 end

```

The following command will be used when the final user has set `print=false`.

```

3570 function piton.GobbleParseNoPrint ( lang , n , code )
3571     piton.last_code = piton.Gobble ( n , code )
3572     piton.last_language = lang
3573     piton.join_and_write ( )
3574 end

```

The following function will be used when the key `split-on-empty-lines` is in force. With that key, the informatic code is split in chunks at the empty lines (usually between the informatic functions defined in the informatic code). LaTeX will be able to change the page between the chunks. The second argument `n` corresponds to the value of the key `gobble` (number of spaces to gobble).

```

3575 function piton.GobbleSplitParse ( lang , n , splittable , code )
3576     local chunks
3577     chunks =
3578     (
3579         Ct (
3580             (
3581                 P " " ^ 0 * "\r"
3582             +
3583                 C ( ( ( 1 - P "\r" ) ^ 1 * ( P "\r" + -1 )
3584                     - ( P " " ^ 0 * ( P "\r" + -1 ) )
3585                 ) ^ 1
3586             )
3587         ) ^ 0
3588     )
3589     ) : match ( piton.Gobble ( n , code ) )
3590     sprintL3 [[ \begingroup ]]
3591     sprintL3
3592     (
3593         [[ \PitonOptions { split-on-empty-lines = false, gobble = 0, ]]
3594         .. "language = " .. lang .. ","
3595         .. "splittable = " .. splittable .. "}"
3596     )
3597     for k , v in pairs ( chunks ) do
3598         if k > 1 then
3599             sprintL3 ( [[ \l_@@_split_separation_tl ]] )
3600         end
3601         tex.print
3602         (
3603             [[\begin{}} .. piton.env_used_by_split .. "}\r"
3604             .. v
3605             .. [[\end{}} .. piton.env_used_by_split .. "}\r" -- previously: }%\r
3606         )
3607     end

3609 end

```

```

3610 function piton.RetrieveGobbleSplitParse ( lang , n , splittable , code )
3611     local s
3612     s = ( ( P " " ^ 0 * "\r" ) ^ -1 * C ( P ( 1 ) ^ 0 ) * -1 ) : match ( code )
3613     piton.GobbleSplitParse ( lang , n , splittable , s )
3614 end

```

The following Lua string will be inserted between the chunks of code created when the key `split-on-empty-lines` is in force. It's used only once: you have given a name to that Lua string only for legibility. The token list `\l_@@_split_separation_tl` corresponds to the key `split-separation`. That token list must contain elements inserted in *vertical mode* of TeX.

```

3615 piton.string_between_chunks =
3616 [[ \par \l_@@_split_separation_tl \mode_leave_vertical: ]]
3617 .. [[ \int_gzero:N \g_@@_line_int ]]

```

The counter `\g_@@_line_int` will be used to control the points where the code may be broken by a change of page (see the key `splittable`).

The following public Lua function is provided to the developer.

```

3618 function piton.get_last_code ( )
3619     return LPEG_cleaner[piton.last_language] : match ( piton.last_code )
3620         : gsub('\r\n','\n') : gsub('\r','\n')
3621 end

```

10.3.13 To count the number of lines

```

3622 function piton.CountLines ( code )
3623     local count = 0
3624     count =
3625         ( Ct ( ( ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3626             * ( ( 1 - P "\r" ) ^ 1 * Cc "\r" ) ^ -1
3627             * -1
3628             ) / table.getn
3629         ) : match ( code )
3630     sprintL3 ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
3631 end

```

The following function is only used once (in `piton.GobbleParse`). We have written an autonomous function only for legibility. The number of lines of the code will be stored in `\l_@@_nb_non_empty_lines_int`. It will be used to compute the largest number of lines to write (when `line-numbers` is in force).

```

3632 function piton.CountNonEmptyLines ( code )
3633     local count = 0
3634     count =
3635         ( Ct ( ( P " " ^ 0 * "\r"
3636             + ( 1 - P "\r" ) ^ 0 * C "\r" ) ^ 0
3637             * ( 1 - P "\r" ) ^ 0
3638             * -1
3639             ) / table.getn
3640         ) : match ( code )
3641     sprintL3
3642         ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { %i } ]], count ) )
3643 end

```

```

3644 function piton.CountLinesFile ( name )
3645     local count = 0
3646     for line in io.lines ( name ) do count = count + 1 end
3647     sprintL3
3648         ( string.format ( [[ \int_set:Nn \l_@@_nb_lines_int { %i } ]], count ) )
3649 end

```

```

3650 function piton.CountNonEmptyLinesFile ( name )

```

```

3651 local count = 0
3652 for line in io.lines ( name ) do
3653     if not ( ( P " " ^ 0 * -1 ) : match ( line ) ) then
3654         count = count + 1
3655     end
3656 end
3657 sprintL3
3658 ( string.format ( [[ \int_set:Nn \l_@@_nb_non_empty_lines_int { % i } ]], count ) )
3659 end

```

The following function stores in `\l_@@_first_line_int` and `\l_@@_last_line_int` the numbers of lines of the file `file_name` corresponding to the strings `marker_beginning` and `marker_end`.

`s` is the marker of the beginning and `t` is the marker of the end.

```

3660 function piton.ComputeRange(s,t,file_name)
3661     local first_line = -1
3662     local count = 0
3663     local last_found = false
3664     for line in io.lines ( file_name ) do
3665         if first_line == -1 then
3666             if string.sub ( line , 1 , #s ) == s then
3667                 first_line = count
3668             end
3669         else
3670             if string.sub ( line , 1 , #t ) == t then
3671                 last_found = true
3672                 break
3673             end
3674         end
3675         count = count + 1
3676     end
3677     if first_line == -1 then
3678         sprintL3 [[ \@@_error_or_warning:n { begin-marker-not-found } ]]
3679     else
3680         if last_found == false then
3681             sprintL3 [[ \@@_error_or_warning:n { end-marker-not-found } ]]
3682         end
3683     end
3684     sprintL3 (
3685         [[ \int_set:Nn \l_@@_first_line_int { } ]] .. first_line .. ' + 2 }'
3686         .. [[ \int_set:Nn \l_@@_last_line_int { } ]] .. count .. ' }' )
3687 end

```

10.3.14 To determine the empty lines of the listings

Despite its name, the Lua function `ComputeLinesStatus` computes `piton.lines_status` but also `piton.empty_lines`.

In `piton.empty_lines`, a line will have the number 0 if it's a empty line (in fact a blank line, with only spaces) and 1 elsewhere.

In `piton.lines_status`, each line will have a status with regard the breaking points allowed (for the changes of pages).

- 0 if the line is empty and a page break is allowed;
- 1 if the line is not empty but a page break is allowed after that line;
- 2 if a page break is *not* allowed after that line (empty or not empty).

`splittable` is the value of `\l_@@_splittable_int`. However, if `splittable-on-empty-lines` is in force, `splittable` is the opposite of `\l_@@_splittable_int`.

```

3688 function piton.ComputeLinesStatus ( code , splittable )

```

The lines in the listings which correspond to the beginning or the end of an environment of Beamer (eg. `\begin{uncoverenv}`) must be retrieved (those lines have *no* number and therefore, *no* status).

```

3689 local lpeg_line_beamer
3690 if piton.beamer then
3691   lpeg_line_beamer =
3692     space ^ 0
3693     * P [[\begin{}} * beamerEnvironments * "]"
3694     * ( "<" * ( 1 - P ">" ) ^ 0 * ">" ) ^ -1
3695   +
3696     space ^ 0
3697     * P [[\end{}} * beamerEnvironments * "]"
3698 else
3699   lpeg_line_beamer = P ( false )
3700 end
3701 local lpeg_empty_lines =
3702   Ct (
3703     ( lpeg_line_beamer * "\r"
3704       +
3705       P " " ^ 0 * "\r" * Cc ( 0 )
3706       +
3707       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3708     ) ^ 0
3709     *
3710     ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3711   )
3712   * -1
3713 local lpeg_all_lines =
3714   Ct (
3715     ( lpeg_line_beamer * "\r"
3716       +
3717       ( 1 - P "\r" ) ^ 0 * "\r" * Cc ( 1 )
3718     ) ^ 0
3719     *
3720     ( lpeg_line_beamer + ( 1 - P "\r" ) ^ 1 * Cc ( 1 ) ) ^ -1
3721   )
3722   * -1

```

We begin with the computation of `piton.empty_lines`. It will be used in conjunction with `line-numbers`.

```

3723 piton.empty_lines = lpeg_empty_lines : match ( code )

```

Now, we compute `piton.lines_status`. It will be used in conjunction with `splittable` and `splittable-on-empty-lines`.

Now, we will take into account the current value of `\l_@@_splittable_int` (provided by the *absolute value* of the argument `splittable`).

```

3724 local lines_status
3725 local s = splittable
3726 if splittable < 0 then s = - splittable end
3727 if splittable > 0 then
3728   lines_status = lpeg_all_lines : match ( code )
3729 else

```

Here, we should try to copy `piton.empty_lines` but it's not easy.

```

3730 lines_status = lpeg_empty_lines : match ( code )
3731 for i , x in ipairs ( lines_status ) do
3732   if x == 0 then
3733     for j = 1 , s - 1 do
3734       if i + j > #lines_status then break end
3735       if lines_status[i+j] == 0 then break end
3736       lines_status[i+j] = 2
3737     end
3738     for j = 1 , s - 1 do

```

```

3739         if i - j == 1 then break end
3740         if lines_status[i-j-1] == 0 then break end
3741         lines_status[i-j-1] = 2
3742     end
3743 end
3744 end
3745 end

```

In all cases (whatever is the value of `splittable-on-empty-lines`) we have to deal with both extremities of the listing to format.

First from the beginning of the code.

```

3746 for j = 1 , s - 1 do
3747     if j > #lines_status then break end
3748     if lines_status[j] == 0 then break end
3749     lines_status[j] = 2
3750 end

```

Now, from the end of the code.

```

3751 for j = 1 , s - 1 do
3752     if #lines_status - j == 0 then break end
3753     if lines_status[#lines_status - j] == 0 then break end
3754     lines_status[#lines_status - j] = 2
3755 end

```

```

3756 piton.lines_status = lines_status
3757 end

```

10.3.15 To create new languages with the syntax of listings

```

3758 function piton.new_language ( lang , definition )
3759     lang = string.lower ( lang )

3760     local alpha , digit = lpeg.alpha , lpeg.digit
3761     local extra_letters = { "@" , "_" , "$" } -- $

```

The command `add_to_letter` (triggered by the key `)` don't write right away in the LPEG pattern of the letters in an intermediate `extra_letters` because we may have to retrieve letters from that "list" if there appear in a key `alsoother`.

```

3762 function add_to_letter ( c )
3763     if c ~= " " then table.insert ( extra_letters , c ) end
3764 end

```

For the digits, it's straitforward.

```

3765 function add_to_digit ( c )
3766     if c ~= " " then digit = digit + c end
3767 end

```

The main use of the key `alsoother` is, for the language LaTeX, when you have to retrieve some characters from the list of letters, in particular `@` and `_` (which, by default, are not allowed in the name of a control sequence in TeX).

(In the following LPEG we have a problem when we try to add `{` and `}`).

```

3768 local other = S " :_@+~*/<>!?. ( ) [] ~^=#&\"\\'\\$" -- $
3769 local extra_others = { }

3770 function add_to_other ( c )
3771     if c ~= " " then

```

We will use `extra_others` to retrieve further these characters from the list of the letters.

```

3772     extra_others[c] = true

```

The LPEG pattern `other` will be used in conjunction with the key `tag` (mainly for languages such as HTML and XML) for the character `/` in the closing tags `</....>`).

```

3773     other = other + P ( c )
3774 end
3775 end

```

Now, the first transformation of the definition of the language, as provided by the final user in the argument `definition` of `piton.new_language`.

```

3776 local def_table
3777 if ( S ", " ^ 0 * -1 ) : match ( definition ) then
3778     def_table = {}
3779 else
3780     local strict_braces =
3781         P { "E" ,
3782             E = ( "{" * V "F" * "}" + ( 1 - S ",{" }" ) ) ^ 0 ,
3783             F = ( "{" * V "F" * "}" + ( 1 - S "{" }" ) ) ^ 0
3784         }
3785     local cut_definition =
3786         P { "E" ,
3787             E = Ct ( V "F" * ( ", " * V "F" ) ^ 0 ) ,
3788             F = Ct ( space ^ 0 * C ( alpha ^ 1 ) * space ^ 0
3789                 * ( "=" * space ^ 0 * C ( strict_braces ) ) ^ -1 )
3790         }
3791     def_table = cut_definition : match ( definition )
3792 end

```

The definition of the language, provided by the final user of `piton` is now in the Lua table `def_table`. We will use it *several times*.

The following LPEG will be used to extract arguments in the values of the keys (`morekeywords`, `morecomment`, `morestring`, etc.).

```

3793 local tex_braced_arg = "{" * C ( ( 1 - P "}" ) ^ 0 ) * "}"
3794 local tex_arg = tex_braced_arg + C ( 1 )
3795 local tex_option_arg = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]" + Cc ( nil )
3796 local args_for_tag
3797     = tex_option_arg
3798     * space ^ 0
3799     * tex_arg
3800     * space ^ 0
3801     * tex_arg
3802 local args_for_morekeywords
3803     = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3804     * space ^ 0
3805     * tex_option_arg
3806     * space ^ 0
3807     * tex_arg
3808     * space ^ 0
3809     * ( tex_braced_arg + Cc ( nil ) )
3810 local args_for_moredelims
3811     = ( C ( P "*" ^ -2 ) + Cc ( nil ) ) * space ^ 0
3812     * args_for_morekeywords
3813 local args_for_morecomment
3814     = "[" * C ( ( 1 - P "]" ) ^ 0 ) * "]"
3815     * space ^ 0
3816     * tex_option_arg
3817     * space ^ 0
3818     * C ( P ( 1 ) ^ 0 * -1 )

```

We scan the definition of the language (i.e. the table `def_table`) in order to detect the potential key **sensitive**. Indeed, we have to catch that key before the treatment of the keywords of the language. We will also look for the potential keys `alsodigit`, `alsoletter` and `tag`.

```

3819 local sensitive = true
3820 local style_tag , left_tag , right_tag
3821 for _ , x in ipairs ( def_table ) do

```

```

3822 if x[1] == "sensitive" then
3823     if x[2] == nil or ( P "true" ) : match ( x[2] ) then
3824         sensitive = true
3825     else
3826         if ( P "false" + P "f" ) : match ( x[2] ) then sensitive = false end
3827     end
3828 end
3829 if x[1] == "alsodigit" then x[2] : gsub ( "." , add_to_digit ) end
3830 if x[1] == "alsoletter" then x[2] : gsub ( "." , add_to_letter ) end
3831 if x[1] == "alsoother" then x[2] : gsub ( "." , add_to_other ) end
3832 if x[1] == "tag" then
3833     style_tag , left_tag , right_tag = args_for_tag : match ( x[2] )
3834     style_tag = style_tag or [[\PitonStyle{Tag}]]
3835 end
3836 end

```

Now, the LPEG for the numbers. Of course, it uses digit previously computed.

```

3837 local Number =
3838     K ( 'Number.Internal' ,
3839         ( digit ^ 1 * "." * # ( 1 - P "." ) * digit ^ 0
3840           + digit ^ 0 * "." * digit ^ 1
3841           + digit ^ 1 )
3842         * ( S "eE" * S "+-" ^ -1 * digit ^ 1 ) ^ -1
3843         + digit ^ 1
3844     )
3845 local string_extra_letters = ""
3846 for _ , x in ipairs ( extra_letters ) do
3847     if not ( extra_others[x] ) then
3848         string_extra_letters = string_extra_letters .. x
3849     end
3850 end
3851 local letter = alpha + S ( string_extra_letters )
3852     + P "â" + "ä" + "ç" + "é" + "ê" + "ë" + "ï" + "î"
3853     + "ô" + "û" + "ü" + "À" + "Â" + "Ç" + "É" + "Ê" + "Ë" + "Ï"
3854     + "Î" + "Ï" + "Ō" + "Ū" + "Ū"
3855 local alphanum = letter + digit
3856 local identifier = letter * alphanum ^ 0
3857 local Identifier = K ( 'Identifier.Internal' , identifier )

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the keywords.

The following LPEG does *not* catch the optional argument between square brackets in first position.

```

3858 local split_clist =
3859     P { "E" ,
3860         E = ( "[" * ( 1 - P "]" ) ^ 0 * "]" ) ^ -1
3861             * ( P "{" ) ^ 1
3862             * Ct ( V "F" * ( "," * V "F" ) ^ 0 )
3863             * ( P "}" ) ^ 1 * space ^ 0 ,
3864         F = space ^ 0 * C ( letter * alphanum ^ 0 + other ^ 1 ) * space ^ 0
3865     }

```

The following function will be used if the keywords are not case-sensitive.

```

3866 local keyword_to_lpeg
3867 function keyword_to_lpeg ( name ) return
3868     Q ( Cmt (
3869         C ( identifier ) ,
3870         function ( s , i , a ) return
3871             string.upper ( a ) == string.upper ( name )
3872         end
3873     ) )
3874 end
3875 local Keyword = P ( false )
3876 local PrefixedKeyword = P ( false )

```

Now, we actually treat all the keywords and also the key `moredirectives`.

```

3878 for _ , x in ipairs ( def_table )
3879 do if x[1] == "morekeywords"
3880     or x[1] == "otherkeywords"
3881     or x[1] == "moredirectives"
3882     or x[1] == "moretexcs"
3883 then
3884     local keywords = P ( false )
3885     local style = [[\PitonStyle{Keyword}]]
3886     if x[1] == "moredirectives" then style = [[\PitonStyle{Directive}]] end
3887     style = tex_option_arg : match ( x[2] ) or style
3888     local n = tonumber ( style )
3889     if n then
3890         if n > 1 then style = [[\PitonStyle{Keyword}] .. style .. "]" end
3891     end
3892     for _ , word in ipairs ( split_clist : match ( x[2] ) ) do
3893         if x[1] == "moretexcs" then
3894             keywords = Q ( [[\]] .. word ) + keywords
3895         else
3896             if sensitive

```

The documentation of `lstlistings` specifies that, for the key `morekeywords`, if a keyword is a prefix of another keyword, then the prefix must appear first. However, for the `lpeg`, it's rather the contrary. That's why, here, we add the new element *on the left*.

```

3897         then keywords = Q ( word ) + keywords
3898         else keywords = keyword_to_lpeg ( word ) + keywords
3899     end
3900 end
3901 end
3902 Keyword = Keyword +
3903     Lc ( "{" .. style .. "{" ) * keywords * Lc "}"
3904 end

```

Of course, the feature with the key `keywordsprefix` is designed for the languages TeX, LaTeX, et al. In that case, there is two kinds of keywords (= control sequences).

- those beginning with `\` and a sequence of characters of catcode “`letter`”;
- those beginning by `\` followed by one character of catcode “`other`”.

The following code addresses both cases. Of course, the LPEG pattern `letter` must catch only characters of catcode “`letter`”. That's why we have a key `alsoletter` to add new characters in that category (e.g. : when we want to format L3 code). However, the LPEG pattern is allowed to catch *more* than only the characters of catcode “`other`” in TeX.

```

3905 if x[1] == "keywordsprefix" then
3906     local prefix = ( ( C ( 1 - P " " ) ^ 1 ) * P " " ^ 0 ) : match ( x[2] )
3907     PrefixedKeyword = PrefixedKeyword
3908         + K ( 'Keyword' , P ( prefix ) * ( letter ^ 1 + other ) )
3909 end
3910 end

```

Now, we scan the definition of the language (i.e. the table `def_table`) for the strings.

```

3911 local long_string = P ( false )
3912 local Long_string = P ( false )
3913 local LongString = P ( false )
3914 local central_pattern = P ( false )
3915 for _ , x in ipairs ( def_table ) do
3916     if x[1] == "morestring" then
3917         arg1 , arg2 , arg3 , arg4 = args_for_morekeywords : match ( x[2] )
3918         arg2 = arg2 or [[\PitonStyle{String.Long}]]
3919         if arg1 ~= "s" then
3920             arg4 = arg3
3921         end
3922         central_pattern = 1 - S ( " \r" .. arg4 )

```

```

3923     if arg1 : match "b" then
3924         central_pattern = P ( [[\]] .. arg3 ) + central_pattern
3925     end

```

In fact, the specifier *d* is point-less: when it is not in force, it's still possible to double the delimiter with a correct behaviour of *piton* since, in that case, *piton* will compose *two* contiguous strings...

```

3926     if arg1 : match "d" or arg1 == "m" then
3927         central_pattern = P ( arg3 .. arg3 ) + central_pattern
3928     end
3929     if arg1 == "m"
3930     then prefix = B ( 1 - letter - ")" - "]" )
3931     else prefix = P ( true )
3932     end

```

First, a pattern *without captures* (needed to compute braces).

```

3933     long_string = long_string +
3934         prefix
3935         * arg3
3936         * ( space + central_pattern ) ^ 0
3937         * arg4

```

Now a pattern *with captures*.

```

3938     local pattern =
3939         prefix
3940         * Q ( arg3 )
3941         * ( SpaceInString + Q ( central_pattern ^ 1 ) + EOL ) ^ 0
3942         * Q ( arg4 )

```

We will need *Long_string* in the nested comments.

```

3943     Long_string = Long_string + pattern
3944     LongString = LongString +
3945         Ct ( Cc "Open" * Cc ( "{" .. arg2 .. "{" ) * Cc "}" )
3946         * pattern
3947         * Ct ( Cc "Close" )
3948     end
3949 end

```

The argument of *Compute_braces* must be a pattern *which does no catching* corresponding to the strings of the language.

```

3950     local braces = Compute_braces ( long_string )
3951     if piton.beamer then Beamer = Compute_Beamer ( lang , braces ) end
3952
3953     DetectedCommands =
3954         Compute_DetectedCommands ( lang , braces )
3955         + Compute_RawDetectedCommands ( lang , braces )
3956
3957     LPEG_cleaner[lang] = Compute_LPEG_cleaner ( lang , braces )

```

Now, we deal with the comments and the delims.

```

3958     local CommentDelim = P ( false )
3959
3960     for _ , x in ipairs ( def_table ) do
3961         if x[1] == "morecomment" then
3962             local arg1 , arg2 , other_args = args_for_morecomment : match ( x[2] )
3963             arg2 = arg2 or [[\PitonStyle{Comment}]]

```

If the letter *i* is present in the first argument (eg: *morecomment* = *[si]{(*){*}}*), then the corresponding comments are discarded.

```

3964         if arg1 : match "i" then arg2 = [[\PitonStyle{Discard}]] end
3965         if arg1 : match "l" then
3966             local arg3 = ( tex_braced_arg + C ( P ( 1 ) ^ 0 * -1 ) )
3967             : match ( other_args )
3968             if arg3 == [[\#]] then arg3 = "#" end -- mandatory
3969             if arg3 == [[\%]] then arg3 = "%" end -- mandatory
3970             CommentDelim = CommentDelim +

```

```

3971      Ct ( Cc "Open"
3972          * Cc ( "{" .. arg2 .. "{" ) * Cc "}" )

10.3.16 We write the files (key 'write') and join the files in the PDF (key 'join')

```

4131 function piton.join_and_write_files ( )
4132   for file_name , file_content in pairs ( piton.write_files ) do
4133     local file = io.open ( file_name , "w" )
4134     if file then
4135       file : write ( file_content )
4136       file : close ( )
4137     else
4138       sprintL3
4139       ( [ [ \@@_error_or_warning:nn { FileError } { } ] ] .. file_name .. [ [ } ] ] )
4140     end
4141   end
4142   for file_name , file_content in pairs ( piton.join_files ) do
4143     pdf.immediateobj("stream", file_content)
4144     tex.print

```

```

4145      (
4146      [[ \pdfextension annot width Opt height Opt depth Opt ]]
4147      ..

```

The entry `/F` in the PDF dictionary of the annotation is an unsigned 32-bit integer containing flags specifying various characteristics of the annotation. The bit in position 2 means *Hidden*. However, despite that bit which means *Hidden*, some PDF readers show the annotation. That's why we have used `width Opt height Opt depth Opt`.

```

4148      [[ { /Subtype /FileAttachment /F 2 /Name /Paperclip}]
4149      ..
4150      [[ /Contents (File included by the key 'join' of piton) ]]
4151      ..

```

We recall that the value of `file_name` comes from the key `join`, and that we have converted immediately the value of the key in utf16 (with the bom big endian) written in hexadecimal. It's the suitable form for insertion as value of the key `/UF` between angular brackets `<` and `>`.

```

4152      [[ /FS << /Type /Filespec /UF <]] .. file_name .. [>]]
4153      ..
4154      [[ /EF << /F \pdffeedback lastobj 0 R >> >> } ]]
4155      )
4156      end
4157      end
4158
4159
4160 </LUA>

```

11 History

The successive versions of the file `piton.sty` provided by TeXLive are available on the SVN server of TeXLive:

<https://tug.org/svn/texlive/trunk/Master/texmf-dist/tex/lualatex/piton/piton.sty>

The development of the extension `piton` is done on the following GitHub repository:

<https://github.com/fpantigny/piton>

Changes between versions 4.5 and 4.6

New keys `tcolorbox`, `box`, `max-width` and `vertical-detected-commands`

New special color: `none`

Changes between versions 4.4 and 4.5

New key `print`

`\RenewPitonEnvironment`, `\DeclarePitonEnvironment` and `\ProvidePitonEnvironment` have been added.

Changes between versions 4.3 and 4.4

New key `join` which generates files embedded in the PDF as *joined files*.

Changes between versions 4.2 and 4.3

New key `raw-detected-commands`

The key `old-PitonInputFile` has been deleted.

Changes between versions 4.1 and 4.2

New key `break-numbers-anywhere`.

Changes between versions 4.0 and 4.1

New language `verbatim`.

New key `break-strings-anywhere`.

Changes between versions 3.1 and 4.0

This version introduces an incompatibility: the syntax for the relative and absolute paths in `\PitonInputFile` and the key `path` has been changed to be conform to usual conventions. An temporary key `old-PitonInputFile`, available at load-time, has been added for backward compatibility.

New keys `font-command`, `splittable-on-empty-lines` and `env-used-by-split`.

Changes between versions 3.0 and 3.1

Keys `line-numbers/format`, `detected-beamer-commands` and `detected-beamer-environments`.

Changes between versions 2.8 and 3.0

New command `\NewPitonLanguage`. Thanks to that command, it's now possible to define new computer languages with the syntax used by listings. Therefore, it's possible to say that virtually all the computer languages are now supported by `piton`.

Changes between versions 2.7 and 2.8

The key `path` now accepts a *list* of paths where the files to include will be searched.

New commands `\PitonInputFileT`, `\PitonInputFileF` and `\PitonInputFileTF`.

Changes between versions 2.6 and 2.7

New keys `split-on-empty-lines` and `split-separation`

Changes between versions 2.5 and 2.6

API: `piton.last_code` and `\g_piton_last_code_tl` are provided.

Changes between versions 2.4 and 2.5

New key `path-write`

Changes between versions 2.3 and 2.4

The key `identifiers` of the command `\PitonOptions` is now deprecated and replaced by the new command `\SetPitonIdentifier`.

A new special language called “minimal” has been added.

New key `detected-commands`.

Changes between versions 2.2 and 2.3

New key `detected-commands`

The variable `\l_piton_language_str` is now public.

New key `write`.

Changes between versions 2.1 and 2.2

New key `path` for `\PitonOptions`.

New language `SQL`.

It's now possible to define styles locally to a given language (with the optional argument of `\SetPitonStyle`).

Changes between versions 2.0 and 2.1

The key `line-numbers` has now subkeys `line-numbers/skip-empty-lines`, `line-numbers/label-empty-lines`, etc.

The key `all-line-numbers` is deprecated: use `line-numbers/skip-empty-lines=false`.

New system to import, with `\PitonInputFile`, only a part (of the file) delimited by textual markers.

New keys `begin-escape`, `end-escape`, `begin-escape-math` and `end-escape-math`.

The key `escape-inside` is deprecated: use `begin-escape` and `end-escape`.

Acknowledgments

Acknowledgments to Yann Salmon for its numerous suggestions of improvements.
